

Waves

section 1 Wave Behavior

● Before You Read

Have you ever shouted and heard an echo? On the lines below, write about what you think causes an echo.

● Read to Learn

Reflection

You can see yourself in a mirror because waves of light are reflected. Reflect means to throw back. **Reflection** happens when a wave hits an object or surface and bounces off. Light waves from the Sun or a lightbulb bounce off of your face. The light waves hit the mirror and reflect back to your eyes. So you see your reflection in the mirror.

You can see your reflection in the smooth surface of a pond, too. But, if the water has ripples or waves, it is harder to see your reflection. You cannot see a sharp image when light reflects from an uneven surface like ripples on the water. This is because the reflected light goes in many different directions.

Refraction

A wave changes direction when it reflects from a surface. Waves can also change direction in another way. Have you ever tried to grab a sinking object in a swimming pool, but missed it? You were probably sure you grabbed right where it was. But, the light waves from the object changed direction when they moved from the water to the air. The bending of a wave as it moves from one medium to another is **refraction**.

What You'll Learn

- how waves can reflect
- how waves change direction
- how waves can bend around barriers

Identify Details

Highlight each question head. Then use another color to highlight the answer to each question.

FOLDABLES

④ Organize Information

Use four quarter-sheets of paper to take notes about reflection, refraction, diffraction, and interference as you read.

Coleman,M.H. Gurtin,R.I. Herrera,C. Truesdell,2012-12-06 Common experience reveals two basic aspects of wave propagation First while preserving their identity and travelling at definite speeds sounds finally die out Second weak sounds may combine to form strong noises Theories of

acoustic propagation have succeeded in representing these aspects of experience separately but never combined as in nature. The classical theories of sound in perfect fluids and elastic solids easily yield common speeds of propagation for plane infinitesimal disturbances but no damping. Moreover within EULER'S theory of the perfect fluid or its generalization the GREEN-KIRCHHOFF-KELVIN theory of finite elasticity weak waves may grow stronger and become shock waves which propagate according to more complicated but equally definite principles. Effects of internal damping are easily added for theories of infinitesimal deformation but for finite motions a dead end was reached about sixty years ago. Indeed in 1901 DUHEM proved that according to the NAVIER-STOKES theory of fluids acceleration waves and waves of higher order cannot exist and for shock waves he claimed a similar result which has since been shown to be valid subject to certain qualifications. So as to save the phenomena of sound and noise as was necessary if the NAVIER-STOKES theory was to deserve the place proposed for it as a refinement upon EULER'S theory DUHEM introduced the concept of quasi wave a region of rapid but continuous transition.
