19. When monochromatic light is used with a diffraction grating, what is produced?
 a. no diffraction pattern
 b. no central band, but bright bands to the left and right
c. a bright central band with bright bands to the left and right

- d. a dark central band with white bands to the left and right

20. How do the screen locations of the red lines produced by red light differ on a diffraction grating compared with the locations of the red lines produced by white light?

- a. Those produced by the red light are closer.
 b. Those produced by the red light are to the left.
 c. Those produced by the white light are closer together.

In your textbook, read about telescopes and microscope resolution.

For each of the statements below, write true or false in the indicated space to make the statement true.

23. _____ **wider** Decreasing the width of a lens used in a telescope causes the diffraction pattern to become narrower.

24. _____ **true** Two stars will be just resolved if the central bright band of one star falls on the first dark band of the second star.

25. _____ **narrower** The diffraction pattern formed by blue light in a microscope is wider than that formed by red light.

26. _____ **microscopes only** Using a larger lens is practical in reducing effects of diffraction on the resolving power of both microscopes and telescopes.
