**Structural Geology Algorithms** Richard W. Allmendinger, Nestor Cardozo, Donald M. Fisher, 2011-12-01 State of the art analysis of geological structures has become increasingly quantitative but traditionally graphical methods are used in teaching This innovative lab book provides a unified methodology for problem solving in structural geology using linear algebra and computation Assuming only limited mathematical training the book begins with classic orientation problems and progresses to more fundamental topics of stress strain and error propagation It introduces linear algebra methods as the foundation for understanding vectors and tensors and demonstrates the application of geometry and kinematics in geoscience without requiring students to take a supplementary mathematics course All algorithms are illustrated with a suite of online MATLAB functions allowing users to modify the code to solve their own structural problems Containing 20 worked examples and over 60 exercises this is the ideal lab book for advanced undergraduates or beginning graduate students It will also provide professional structural geologists with a valuable reference and refresher for calculations

Problems Structural Geology N.W. Gokhale, 2006-02-01 **3-D Structural Geology** Richard H. Groshong, 2013-03-14 Many important decisions ranging from locating an oil prospect or a land fill site to determining the location and size of an earthquake producing fault are based on geological maps Because a map scale structure is never completely sampled in three dimensions geological maps and the cross sections derived from maps are always interpretations The interpretation may be complicated by direct structural observations like bedding attitudes that are misleading because they represent a local structure not the map scale structure Some data may simply be wrong The interpretation of the geometry of even a single horizon therefore always involves inferences about the validity and meaning of the observations themselves as well as the nature of the geometry between the observation points How is an accurate interpretation to be constructed and how is it to be validated once complete The objective of this book is to demonstrate the concepts and techniques required to obtain the most complete and accurate interpretation of the geometry of structures at the map scale The methods are designed primarily for interpretations based on outcrop measurements and subsurface information of the type derived from well logs and two dimensional seismic reflection profiles These forms of information all present a similar interpretive problem which is to define the geometry from isolated and discontinuous observations The underlying philosophy of interpretation is that structures are three dimensional solid bodies and that data from throughout the body should be integrated into an
