Network Synthesis Problems C. Wynants, 2013-03-14 As the telecommunication industry introduces new sophisticated technologies the nature of services and the volume of demands have changed Indeed a broad range of new services for users appear combining voice data graphics video etc This implies new planning issues Fiber transmission systems that can carry large amounts of data on a few strands of wire were introduced These systems have such a large bandwidth that the failure of even a single transmission link in the network can create a severe service loss to customers Therefore a very high level of service reliability is becoming imperative for both system users and service providers Since equipment failures and accidents cannot be avoided entirely networks have to be designed so as to survive failures This is done by judiciously installing spare capacity over the network so that all traffic interrupted by a failure may be diverted around that failure by way of this spare or reserve capacity This of course translates into huge investments for network operators Designing such survivable networks while minimizing spare capacity costs is not surprisingly a major concern of operating companies which gives rise to very difficult combinatorial problems In order to make telecommunication networks survivable one can essentially use two different strategies protection or restoration The protection approach preassigns spare capacity to protect each element of the network independently while the restoration approach spreads the redundant capacity over the whole network and uses it as required in order to restore the disrupted traffic

Financial Forecasting Jason Kingdon, 2012-12-06 A fundamental objective of Artificial Intelligence AI is the creation of intelligent computer programs In more modest terms AI is simply concerned with expanding the repertoire of computer applications into new domains and to new levels of efficiency The motivation for this effort comes from many sources At a practical level there is always a demand for achieving things in more efficient ways Equally there is the technical challenge of building programs that allow a machine to do something a machine has never done before Both of these desires are contained within AI and both provide the inspirational force behind its development In terms of satisfying both of these

desires there can be no better example than machine learning Machines that can learn have an in built efficiency The same software can be applied in many applications and in many circumstances The machine can adapt its behaviour so as to meet the demands of new or changing environments without the need for costly re programming In addition a machine that can learn can be applied in new domains with the genuine potential for innovation In this sense a machine that can learn can be applied in areas where little is known about possible causal relationships and even in circumstances where causal relationships are judged not to exist This last aspect is of major significance when considering machine learning as applied to financial forecasting

Motivation and Research Questions This work seeks to further our understanding on the management of innovations in network industries Although the economics of network markets like telecommuni tions Internet email media computer and service operations in banking legal and airline industries have become a major field of economic research knowledge about how to manage innovation within these markets is less advanced et al 2000 793 2003 198 The goods and services of these industries regularly manifest themselves as complex system products which are composed of multiple mutually dependent components and often supplied by different industries 1998 691 TIDD 1995 308 Innovation processes associated with complex systems products therefore display a systemic character and the issue of how to coordinate the diverse but nevertheless complementary inputs poses a major challenge for innovation management The issue of how to organise complex innovation projects however is still open for debate A broad range of organisational forms e g vertical integration and TEECE 1996 68 TEECE 1996 205 and 2001 227 decentralised networks BRESNAHAN and 1999 13 14 1999 162 and 1992 310 proje organisationsmHOBDAV 2000 892 has not only been theoretically derived but is reported as well in practical use **Stochastic Project Networks** Klaus Neumann,2012-12-06 Project planning scheduling and control are regularly

used in business and the service sector of an economy to accomplish outcomes with limited resources under critical time constraints To aid in solving these problems network based planning methods have been developed that now exist in a wide variety of forms cf Elmaghraby 1977 and Moder et al 1983 The so called classical project networks which are used in the network techniques CPM and PERT and which represent acyclic weighted directed graphs are able to describe only projects whose evolution in time is uniquely specified in advance Here every event of the project is realized exactly once during a single project execution and it is not possible to return to activities previously carried out that is no feedback is permitted Many practical projects however do not meet those conditions Consider for example a production process where some parts produced by a machine may be poorly manufactured If an inspection shows that a part does not conform to certain specifications it must be repaired or replaced by a new item This means that we have to return to a preceding stage of the production process In other words there is feedback Note that the result of the inspection is that a certain percentage of the parts tested do not conform That is there is a positive probability strictly less than 1 that any part is defective
