Basic Principles of Structural Equation Modeling Ralph O. Mueller, 2012-12-06 During the last two decades structural equation modeling SEM has emerged as a powerful multivariate data analysis tool in social science research settings especially in the fields of sociology psychology and education Although its roots can be traced back to the first half of this century when Spearman 1904 developed factor analysis and Wright 1934 introduced path analysis it was not until the 1970s that the works by Karl Joreskog and his associates e g Joreskog 1977 Joreskog and Van Thillo 1973 began to make general SEM techniques accessible to the social and behavioral science research communities Today with the development and increasing availability of SEM computer programs SEM has become a well established and respected data analysis method incorporating many of the traditional analysis techniques as special cases State of the art SEM software packages such as LISREL Joreskog and Sorbom 1993a b and EQS Bentler 1993 Bentler and Wu 1993 handle a variety of ordinary least squares regression designs as well as complex structural equation models involving variables with arbitrary distributions Unfortunately many students and researchers hesitate to use SEM methods perhaps due to the somewhat complex

underlying statistical representation and theory In my opinion social science students and researchers can benefit greatly from acquiring knowledge and skills in SEM since the methods applied appropriately can provide a bridge between the theoretical and empirical aspects of behavioral research

Structural Equation Modeling Shawn Bauldry, 2020 Structural equation models SEMs refer to a broad class of statistical models that have two components a measurement component that relates latent or unobserved variables to observed indicators and a structural component that captures direct effects if any of latent or observed variables on each other As such SEMs provide a framework for addressing measurement error and for specifying systems of equations that correspond with theory This entry provides an overview of SEMs that focuses on the general SEM and the process involved in an SEM analysis A typical SEM analysis unfolds in five steps The first step involves model specification in which an analyst brings theory and substantive knowledge to decide on the structure of the model The second step involves assessing whether the specified model is identified Once a model is identified the third step is to estimate the parameters using one of the several estimators available for SEMs The fourth step includes examining the fit of the model both overall and in components and relative to alternative models if desired In many cases initial models turn out to have poor fit with the structure of the data and thus the fifth step concerns respecification or considering alternative models that may have better fit This entry concludes with a brief discussion of three particularly notable extensions of the general SEM the incorporation of categorical endogenous observed variables the specification of categorical latent variables and the use of SEMs with longitudinal data

New Developments and Techniques in Structural Equation Modeling George A. Marcoulides, Randall E. Schumacker, 2001 Featuring contributions from some of the leading researchers in the field of SEM most chapters are written by the author s who originally proposed the technique and or contributed substantially to its development Content highlights include latent variable mixture modeling multilevel modeling interaction modeling models for dealing with nonstandard and noncompliance samples the latest on the analysis of growth curve and longitudinal data

Marcoulides, 2012-08-21 In this book authors Tenko Raykov and George A Marcoulides introduce students to the basics of structural equation modeling SEM through a conceptual nonmathematical approach For ease of understanding the few mathematical formulas presented are used in a conceptual or illustrative nature rather than a computational one Featuring examples from EQS LISREL and Mplus A First Course in Structural Equation Modeling is an excellent beginner's guide to learning how to set up input files to fit the most commonly used types of structural equation models with these programs The basic ideas and methods for conducting SEM are independent of any particular software Highlights of the Second Edition include Review of latent change growth analysis models at an introductory level Coverage of the popular Mplus program Updated examples of LISREL and EQS Downloadable resources that contains all of the text's LISREL EQS and Mplus examples A First Course in Structural Equation Modeling is intended as an introductory book for students and researchers in psychology education business medicine and other applied social behavioral and health sciences with limited or no previous exposure to SEM A prerequisite of basic statistics through regression analysis is recommended The book frequently draws parallels between SEM and regression making this prior knowledge helpful

research and test for the plausibility of the hypothesizing for a particular data set However the popularity of these techniques has often led to misunderstandings of them and even their misuse particularly by students exposed to them for the first time Through the use of careful narrative explanation Maruyama's text describes the logic underlying SEM approaches describes how SEM approaches relate to techniques like regression and factor analysis analyzes the strengths and shortcomings of SEM as compared to alternative methodologies and explores the various methodologies for analyzing structural equation data In addition Maruyama provides carefully constructed exercises both within and at the end of chapters

Structural Equation Modeling and Natural Systems James B. Grace, 2006-08-17 This book first published in 2006 presents an introduction to the methodology of structural equation modeling illustrates its use and goes on to argue that it has revolutionary implications for the study of natural systems A major theme of this book is that we have up to this point attempted to study systems primarily using methods such as the univariate model that were designed only for considering individual processes Understanding systems requires the capacity to examine simultaneous influences and responses Structural equation modeling SEM has such capabilities It also possesses many other traits that add strength to its utility as a means of making scientific progress In light of the capabilities of SEM it can be argued that much of ecological theory is currently locked in an immature state that impairs its relevance It is further argued that the principles of SEM are capable of leading to the development and evaluation of multivariate theories of the sort vitally needed for the conservation of natural systems

Structural Equation Modeling with LISREL Leslie A. Hayduk, 1987 Hayduk is equally at ease explaining the simplest and most advanced applications of the program Hayduk has written more than just a solid text for use in advanced graduate courses on statistical modeling Those with a firm mathematical background who wish to learn about the approach or those who know a little about the program and want to know more will find this an excellent reference
