## **The Queen Bee Illustrated:**

*Bees: Their Habits, Management, and Treatment ... With Illustrations* John George WOOD (M.A.), 1853      **Fanny Brown and Her Honey-bees. [With Illustrations.]** Sophia Tandy, 1875      British Bees (Illustrations) William Edward Shuckard, GENERAL HISTORY OF BEES The bees constitute a family of the order Hymenoptera viz insects ordinarily but in the case of bees always with four transparent wings which are variously but partially traversed longitudinally and transversely with threads called nervures supposed to be tubular the relative position of which together with the areas they enclose called cells help to give characters to the genera Most of the Hymenoptera further possess some kind of an ovipositor of course restricted to the females varying considerably in the different families This is sometimes external but is often seated within the apex of the abdomen whence it can be protruded for the purpose of depositing the egg in its right nidus In our insect this organ is converted into a weapon of defence and offence and forms a sting supplied by glands with a very virulent poison which the bee can inject into the wound it inflicts It is not certain that this organ is used by the bee as an ovipositor although it is evident it is its analogue This brief description of the essential peculiarities of the family will for the present suffice In the notice of the imago I shall enlarge upon the general structure and then particularize those portions of it which may facilitate further progress The Egg Although the egg of the parent is the source of the origin of the bee we cannot abruptly commence from this point for the preliminary labours of the mother are indispensable to the evolution of its offspring This egg has to be placed in a suitable depository together with the requisite food for the sustenance of the vermicule that will be disclosed from it Instinct instructs the parent where and how to form the nidus for its egg These depositories differ considerably in the several genera but as a general rule they are tubes burrowed by the mother either in earth sand decaying or soft wood branches of plants having a pith the halm of grain cavities already existing in many substances and even within the shells of dead snails These perforations are sometimes simple and sometimes they have divergent and ramifying channels Sometimes they are carefully lined with a silky membrane secreted by the insect and sometimes they are hung with a tapestry of pieces of leaves cut methodically from plants but some leave their walls entirely bare All these particulars I shall have ample opportunity to note in the special descriptions of the genera I merely indicate them to show how various are the receptacles for the offspring of our bees Before the egg is placed within its nidus this is supplied with the requisite quantity of food needful for the support of the young to the full period of its maturity The receptacle is then closed and the same process is repeated again and again until the parent has laid her whole store of eggs In other cases one tube or its ramification contains but one egg These eggs are usually oblong slightly curved and tapering at one extremity they vary in size according to the species but are never however above a line in length and sometimes they are very minute When the stock of the mother bee is exhausted she leaves them to the careful nursing of nature and the young is speedily evolved She then wanders forth time has brought senility her occupation has gone and she passes away but her progeny survive to
