

DNA Structure and Replication

How is genetic information stored and copied?

Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

Model 1 – The Structure of DNA

DNA and RNA Linley Erin Hall,2010-08-15 Introduces DNA and RNA discussing how heredity works what can happen when the code goes wrong replication and new advances in science and technology Discovery, the Search for DNA's Secrets Mahlon B. Hoagland,1983 *Genome Stability Maintenance by Human DNA Polymerase Delta* Kara Pytko,2024 Accurate replication of DNA is vital for its transfer to newly formed cells during cell division and crucial for maintaining proper bodily functions This complex process requires intimate coordination among enzymes cofactors and auxiliary proteins as well as sufficient levels of

proteins and metabolites 1 A high fidelity DNA polymerase in humans known as polymerase delta pol delta is mainly responsible for replicating the DNA lagging strand Pol delta possesses both a polymerase active site for synthesizing polymers and an exonuclease active site for proofreading and cleaving nucleotides nt from one end enabling high fidelity DNA synthesis However protein barriers or DNA obstacles such as repetitive sequences or lesions can hinder its progression Despite its mechanisms to prevent or repair DNA errors including proofreading capabilities for mismatched base pairs pol delta can stall at replication forks and is prone to occasional errors 2 3 DNA replication errors can lead to mutations and other anomalies within the human genome contributing to genome instability a hallmark of carcinogenesis 4 Therefore it is crucial to investigate how pol delta navigates these challenges to inform the development of potential therapeutics One of pol delta s interacting partners replication protein A RPA is a multifaceted single stranded DNA ssDNA binding protein that tightly binds and protects ssDNA earning it the title of the ssDNA first responder⁵ RPA s availability during ongoing DNA replication is imperative as it stabilizes vulnerable ssDNA and localizes essential replisome proteins to the primer template P T junction Furthermore its coordination with pol delta is significant as RPA undergoes micro dissociations allowing pol delta to access the template DNA and bind thereby displacing RPA In addition to DNA replication RPA is involved in many other DNA related processes such as DNA damage response DDR and chromosome segregation and it can undergo post translational modifications PTMs Its dynamic multi subunit structure allows it to perform these various functions^{5 16} Therefore it is crucial to study the effects of RPA availability structure and dynamics on metabolic processes like DNA replication and on a broader scale genome stability This dissertation explores how structural changes in biomolecules such as RPA or DNA influence human DNA replication by pol delta More specifically Chapter 2 discusses my work investigating the impact of mutated RPA RPAR382Q on DNA replication by pol delta using F rster Resonance Energy Transfer FRET and reconstituted primer extension assays Despite severe effects on genome stability the RPAR382Q mutation linked to cancers and lethal in human cell lines¹⁷ does not affect DNA replication by pol delta holoenzymes suggesting that the mutation s link to cancer arises from a process other than DNA replication Alternatively it is possible that the effects of RPAR382Q on DNA replication by pol delta are mediated by an unidentified accessory factor In Chapter 3 my research focuses on investigating the replication of AT TA 25 hairpin forming sequences from common fragile sites CFS by pol delta My findings reveal that RPA prevents formation of these hairpins due to its high abundance and affinity for ssDNA Under physiological conditions where RPA and metabolite pools are abundant pol delta proceeds through hairpin forming sequences unhindered Notably the impact of RPA on the replication of AT TA 25 sequences is contingent upon the concentration of dNTPs contrasting with its effects on the replication of A T rich non structure forming sequences which remain unaffected by dNTP concentration These findings collectively underscore the intricate dynamics of AT TA microsatellite repeat replication and offer novel insights into the contribution of CFS to genome instability¹⁸ Appendix A addresses my ongoing research studying the relationship

between DNA replication by pol delta and base excision repair BER with a particular focus on apurinic apyrimidinic endonuclease 1 APE1 cleavage of apurinic apyrimidinic AP sites Investigating APE1 cleavage at replication forks is crucial because cleavage of the ssDNA at a replication fork generates a double stranded break DSB collapsing the replication fork18 19 This study involves separately monitoring APE1 cleavage and DNA replication by pol delta using a recessed AP site on a P T sequence to understand their respective rates followed by simultaneously initiating both processes to better understand their temporal relationship In summary this dissertation underscores the importance of understanding the intricate dynamics of DNA replication particularly in challenging environments Through exploration of the interactions between pol delta RPA and various DNA sequences this dissertation elucidates key mechanisms underlying genome stability maintenance By revealing how these molecular players navigate adverse conditions such as mutated replisome proteins and complex DNA structures this research provides invaluable insights into the factors influencing DNA replication fidelity and genome integrity These findings lay the groundwork for targeted interventions to preserve genomic stability and mitigate disease risk notably cancer
