Light Scattering from Microstructures Fernando Moreno, Francisco Gonzales, 2008-01-11 The classical phenomenon of light scattering is one of the most studied topics in light matter interaction and even today involves some controversial issues A present focus of interest for many researchers is the possibility of obtaining information about microstructures for example surface roughness and the size shape and optical properties of particles by means of a non invasive technique such as the illumination of these objects with light One of their main tasks is to extract the relevant information from a detailed study of the scattered radiation This includes measurement of the light intensity in different directions analysis of its polarization determination of its statistics etc Contributionsto resolving this problem are important not only from the point of view of increasing basic knowledge but also in their applications to several fields of industry and technology Consider for example the possibility of distinguishing between different types of atmospheric contaminants biological contaminants in our blood the detection of microdefects in the manufacturing of semiconductors magnetic discs and optical components or the development of biological sensors During the period September 11 13 1998 we brought together a group of international experts on light scattering at the Summer School of Laredo at the University of Cantabria In a series of one hour lectures they discussed current aspects of light scattering from microstructures with special emphasis on recent applications The present
