

## Population Genetics

- I.** Classical (Mendelian) genetics tracks patterns of inheritance from individual parents to their offspring. These patterns fall into relatively simple statistical patterns. Geneticists are also interested in the ways that genetic traits distribute in breeding populations.
- A.** Population geneticists study the interrelated patterns of phenotypic, genotypic and allelic frequencies within populations. These frequencies are generally expressed in relatively formal statistical notation.
- For each genetically controlled trait, a population will show a characteristic distribution of the possible phenotypes. For example, if the gene in question is the brown/black fur color gene in gerbils, some proportion of the population will be brown and the rest will be black. The frequency of brown gerbils would be represented as  $f(\text{Brown})$ , and would be calculated as the number of brown gerbils in the population divided by the total number of gerbils in the population. The frequency of black gerbils ( $f(\text{black})$ ) would be the number of black gerbils divided by the total number of gerbils. Note that if these are the only two colors of gerbils in the population, their frequencies should add up to 1.0.
  - Of course, the phenotypes of the gerbils are the result of their genotypes. Genotypic frequencies in this example would be  $f(\text{BB})$ ,  $f(\text{Bb})$  and  $f(\text{bb})$ . Again, if this gene has only these two alleles, these three frequencies should add up to 1.0. Not also that the  $f(\text{black})$  will be equal to the  $f(\text{bb})$ , and that the  $f(\text{brown})$  will be equal to the sum of the  $f(\text{BB})$  and the  $f(\text{Bb})$ .
  - At the core of all of the genotypic and phenotypic variation are, of course, alleles. And the frequencies of those alleles are at the core of the calculations of population genetics. In our example, the frequencies of our two alleles would be  $f(\text{B})$  and  $f(\text{b})$ . If there are only two alleles for this gene in the population, then  $f(\text{B})$  and  $f(\text{b})$  will add up to 1.0. It is very common in population genetics to use the symbols  $p$  and  $q$  to represent these allelic frequencies. If there is a dominant allele, it's frequency will be represented as  $p$ . So  $f(\text{B}) = p$  and  $f(\text{b}) = q$ . If there is no dominance (as in incomplete or codominance) either letter may be used for either allele. If the gene has more than one allele, the frequency of the third allele would be represented as  $r$ .
- B.** The total genetic bank of a population is its **gene pool**.
- C.** Not only are population geneticists interested in calculating these frequencies, they are also interested in tracking changes in those frequencies due to influences like selection and chance.
- II.** Given knowledge of genotypic frequencies, it is possible to calculate the allelic frequencies for any population.
- $f(\text{A}) = p$ ;  $f(\text{a}) = q$ .
  - $p = f(\text{A}) = \frac{\# \text{A}}{\text{total } \# \text{ alleles}} = f(\text{AA}) + \frac{1}{2} f(\text{Aa})$
  - $q = f(\text{a}) = \frac{\# \text{a}}{\text{total } \# \text{ alleles}} = f(\text{aa}) + \frac{1}{2} f(\text{Aa})$  -OR-  $q = 1 - p$ . (Remember that  $p + q = 1$ .)
  - This calculation makes no assumptions about the condition of the population. (In other words, it doesn't require that the population be in any kind of equilibrium.)
- III.** Basic population genetics begins with the concept of a "perfect" population in which all allelic frequencies are constant, and in which all mating is random. This ideal population is called a Hardy-Weinberg population, after the statisticians responsible for developing the concept. A population which simulates this ideal population is often described as being "in equilibrium." The relationship between the allelic and genotypic frequencies in this ideal population is described by the Hardy-Weinberg equation (H-W equation).
- A.** In order for allelic frequencies to be stable, five conditions must be met.
- There must be completely non-random mating.

### **Introduction to Genetics**

Sandra Pennington, 2009-07-17 The 11th Hour Series of revision guides are designed for quick reference. The organization of these books actively involves students in the learning process and reinforces concepts. At the end of each chapter there is a test including multiple choice questions, true/false questions, and short answer questions, and every answer involves an explanation. Each book contains icons in the text indicating additional support on a dedicated web page. Students having difficulties with their courses will find this an excellent way to raise their grades. Clinical correlations or everyday applications include examples from the real world to help students understand key concepts more readily. Dedicated web page there 24 hours a day will give extra help, tips, warnings of trouble spots, extra visuals, and more. A quick check on what background students will need to apply helps equip them to conquer a topic. The most important information is highlighted and explained, showing the big picture and eliminating the guesswork. After every topic and every chapter, lots of opportunity for drill is provided in every format: multiple choice, true/false, short answer, essay. An easy trouble spot identifier demonstrates which areas need to be reinforced and where to find information on them. Practice midterms and finals prep them for the real thing.

### **Population Genetics of Forest Trees**

W.T. Adams, Steven H. Strauss, Donald L. Copes, A.R. Griffin, 1992-11-30 Tropical climates which occur between 23° 30' N and S latitude. Jacob 1988 encompass a wide variety of plant communities. Hartshorn 1983, 1988 many of which are diverse in their woody floras. Within this geographic region, temperature and the amount and seasonality of rainfall define habitat types. UNESCO 1978 The FAO has estimated that there are about 19 million km<sup>2</sup> of potentially forested area in the global tropics, of which 58% were estimated to still be in closed forest in the mid 1970s. Sommers 1976 UNESCO 1978 Of this potentially forested region 42% is categorized as dry forest lifezone, 33% is tropical moist forest, and 25% is wet or rain forest. Lugo 1988 The species diversity of these tropical habitats is very high. Raven 1976 in Mooney 1988 estimated that 65% of the 250,000 or more plant species of the earth are found in tropical regions. Of this floristic assemblage a large fraction are woody species. In the well collected tropical moist forest of Barro Colorado Island, Panama, 39.7% (481 of 1212 species) of the native phanerogams are woody, arborescent species. Croat 1978 Another 21.9% are woody vines and lianas. Southeast Asian Dipterocarp forests may contain 120-200 species of trees per hectare. Whitmore 1984 and recent surveys in upper Amazonia recorded from 89 to 283 woody species 10 cm dbh per hectare. Gentry 1988 Tropical communities thus represent a global woody flora of significant scope.

*A baseline studies programme for sustainable and resilient seaweed cultivation in Faroese fjords* Wegeberg, Susse, Mols-Mortensen, Agnes, Hancke, Kasper, á Norði, Gunnvør, Available online <https://pub.norden.org/temanord2023/551>

The overall aim of this report is to provide an overview of the most relevant environmental effects and potential impacts on the marine environment related to seaweed cultivation in the Faroe Islands. The identified environmental impacts were evaluated for their relevance and significance for cultivation in the Faroe Islands. The report includes a number of potential effects and impacts that have been identified and addressed according to their expected significance. From this scoping of potential environmental impacts from seaweed cultivation in the Faroe Islands, a baseline programme is suggested. Such a baseline programme and a consecutive monitoring program is needed to safeguard a future sustainable and resilient macroalgal cultivation in Faroese fjords. The suggested baseline programme is a first step in this direction.

**Population Genetics in Forestry** Hans-Rolf Gregorius, 2013-03-13

When we consider the main object of forestry, the tree, it immediately becomes clear why experimental population geneticists have been so hesitant in making this object a primary concern of their research. Trees are very long living organisms with generation intervals frequently exceeding those of their investigators by multiples. They virtually exclude therefore application of the classical methods of population genetics since these are based on observing genetic structures over generations. This situation, where the limits set to observation are so severe, particularly requires close cooperation between theory and experiment. It also requires careful consideration of results obtained for organisms other than trees in order to gain additional insights by comparing the results for trees with those for other organisms. Yet the greatest challenge to population and ecological genetics probably originates from the fact that forests are very likely to be the most complex ecosystems of all, even in some cases where they are subject to intense management. This complexity, which equally comprises biotic and abiotic factors varying both in time and space, makes extremely high demands on the adaptational capacity and thus flexibility of the carriers of such an ecosystem. Longevity combined with immobility during the vegetative phase, however, appears to contradict the obvious necessity of adaptational flexibility in forest tree populations when compared with short-lived and/or mobile organisms.

**Population Genetics in the Neotropics** Marcos Vinícius Bohrer Monteiro Siqueira, Enéas Ricardo Konzen, Pedro Manoel Galetti Junior, 2025-04-23

The Neotropics hold high levels of biodiversity, figuring among the essential hotspots for conservation on Earth. Invaluable genetic resources of this biogeographic dominion must deserve attention of conservationists as well as of breeders. This project is aimed at producing a book on population genetics directed to an audience of undergraduate and graduate students but not limited to those. In a distinct approach, we seek to develop a material devoted to population genetics in the Neotropics, contextualizing examples of several animal and plant species belonging to this highly diverse dominion. Traditional books available in the subject of population genetics commonly deal with organisms that are native to North America and Europe, while neotropical organisms

are lacking in the context so our book comes forth as an initiative towards covering that Among several subjects this textbook addresses studies on molecular evolution and phylogenetics genetic structure at broad and fine spatial scales landscape genetics niche modeling and climate change conservation genetics and quantitative variation and its genetic components in hotspots of biodiversity such as the Amazon the Brazilian Savanna and the Atlantic Rain Forest It should provide an easy going reading with the main concepts being presented and contextualized within the Neotropical dynamics of plants and animal populations Basic mathematical foundations of population genetics theory are provided but no further details on deductions and advanced algebra are given for the purpose of simplicity The application of the studies on conservation and breeding is also addressed The chapters were planned to be brief describing the main concepts processes and case studies Invited authors were encouraged to describe examples from their own research in the Neotropics Altogether this project may offer students with a textbook with concepts and ideas of the Neotropical genetic diversity bringing awareness and stimulating endeavors towards the continuance of conservation of endangered species in their environments of origin
