

Chemistry – Unit 7 Review

Chemical Reaction Model

1. Describe key characteristics of all chemical reactions, including the role of energy. Explain how a balanced equation represents these features (include an example).

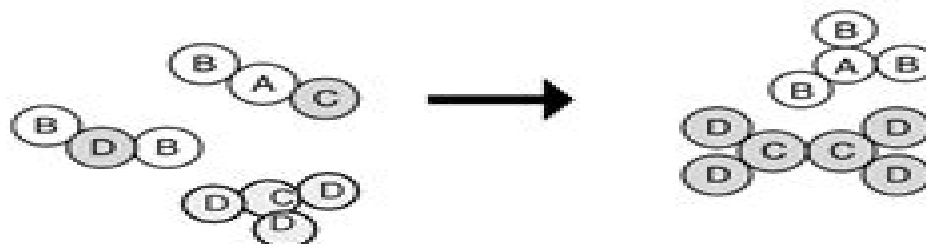

In chemical reactions, atoms of the reactants recombine to form new substances in the products. There is almost always some transfer between the thermal and chemical energy accounts as well as an exchange of thermal energy via heating (Q) between the system and surroundings. The balanced chemical equation represents this process symbolically, showing that the atoms in the products are the same as those in the reactants

Note: there are 4 atoms of H and 2 atoms of O on each side of the equation.

Applying the Model

2. Balance the reaction below by drawing any additional reactant and/or product molecules that would be needed.

Write the **balanced equation** for this reaction.

Which of these molecules would be called reactants?

DB₂, CD₂, and BAC are reactants

Due to the difficulty and expense of obtaining accurate measurements and the unreliability of reported values we know surprisingly little about the properties of these contaminants. Determining the properties of chemicals is critical to judging their impact on environmental quality and in making decisions about emission rates, clean up and other important public health issues. Chemical Property Estimation describes modern methods of estimating chemical properties, methods which cost much less than traditional laboratory techniques and are sufficiently accurate for most environmental applications. Estimation methods are used to screen chemicals for testing, design, monitoring and analysis, methods design, clean up procedures and verify experimental measurements. The book discusses key methods for estimating chemical properties and considers their relative strengths and weaknesses. Several chapters are devoted to the partitioning of chemicals between air, water, soil and biota and properties such as solubility, vapor pressure and chemical transport. Each chapter begins with a review of relevant theory and background information explaining the applications and limitations of each method. Sample calculations and practical advice on how and when to use each method are included as well. Each method is evaluated for accuracy and reliability. Computer software, databases and internet resources are evaluated as well as other supplementary material such as fundamental constants, units of measure and more. Polymer Physics U.W. Gedde, 2013-12-11 This book is the result of my teaching efforts during the last ten years at the Royal Institute

of Technology The purpose is to present the subject of polymer physics for undergraduate and graduate students to focus the fundamental aspects of the subject and to show the link between experiments and theory The intention is not to present a compilation of the currently available literature on the subject Very few reference citations have thus been made Each chapter has essentially the same structure starting with an introduction continuing with the actual subject summarizing the chapter in 300-500 words and finally presenting problems and a list of relevant references for the reader The solutions to the problems presented in Chapters 1-12 are given in Chapter 13 The theme of the book is essentially polymer science with the exclusion of that part dealing directly with chemical reactions The fundamentals in polymer science including some basic polymer chemistry are presented as an introduction in the first chapter The next eight chapters deal with different phenomena processes and states of polymers The last three chapters were written with the intention of making the reader think practically about polymer physics How can a certain type of problem be solved What kinds of experiment should be conducted This book would never have been written without the help of my friend and adviser Dr Anthony Bristow who has spent many hours reading through the manuscript criticizing the content
