Beckenbach, Magnus R. Hestenes, 2013-06-19 The second in this two volume series also contains original papers commissioned from many of the most prominent and accomplished mathematicians of the 20th century A three part treatment covers mathematical methods statistical and scheduling studies and physical phenomena Contributors include William Feller Stanislaw M Ulam and George P Iya 1961 edition **The Schrodinger Model for the Minimal Representation of the Indefinite Orthogonal Group $SO(p, q)$** Toshiyuki Kobayashi, Gen Mano, 2011 The authors introduce a generalization of the Fourier transform denoted by \mathcal{F}_C on the isotropic cone C associated to an indefinite quadratic form of signature n_1, n_2 on $\mathbb{R}^{n_1+n_2}$ even This transform is in some sense the unique and natural unitary operator on $L^2(C)$ as is the case with the Euclidean Fourier transform $\mathcal{F}_{\mathbb{R}^n}$ on $L^2(\mathbb{R}^n)$ Inspired by recent developments of algebraic representation theory of reductive groups the authors shed new light on classical analysis on the one hand and give the global formulas for the L^2 model of the minimal representation of the simple Lie group GO_{n_1, n_2} on the other hand **Memorandum** Rand Corporation, 1968 *A Mutation-Selection Model with Recombination for General Genotypes* Steven Neil Evans, David Steinsaltz, Kenneth W. Wachter, 2013-02-26 The authors investigate a continuous time probability measure valued dynamical system that describes the process of mutation selection balance in a context where the population is infinite there may be infinitely many loci and there are weak assumptions on selective costs Their model arises when they incorporate very general recombination mechanisms into an earlier model of mutation and selection presented by Steinsaltz Evans and Wachter in 2005 and take the relative strength of mutation and selection to be sufficiently small The resulting dynamical system is a flow of measures on the space of loci Each such measure is the intensity measure of a Poisson random measure on the space of loci the points of a realization of the random measure record the set of loci at which the genotype of a uniformly chosen individual differs from a reference wild type due to an accumulation of ancestral mutations The authors motivation for working in such a general setting is to provide a basis for understanding mutation driven changes in age specific demographic schedules that arise from the complex interaction of many genes and hence to develop a framework for understanding the evolution of aging The Mother Body Phase
