NYS REGENTS LAB REVIEW PACKET #2:
Osmosis in a Red Onion

Key Points:

1. Basic parts of the cell that are easily seen under the microscope are the *cytoplasm, cell membrane, and cell wall* (in plants).
2. Molecules tend to move from **HIGH TO LOW** concentration **WITHOUT** the use of energy (*diffusion*).
3. Diffusion of **WATER** molecules is particularly important and has the special name of **OSMOSIS**.
4. The **BALANCE** of water molecules inside and outside the cell is extremely important for the survival of all organisms, including humans.

Procedure:

1. Make a *wet mount* slide of a thin section of red onion cells. The cells are taken from the outer 'skin' of the onion and a small piece is placed in a drop of water on a microscope slide. A *cover slip* is placed on top by touching it to the water at an angle, and then carefully placing it on the specimen, trying not to get air bubbles underneath.
2. The cells are examined under the light (compound) microscope. You should be able to **identify the cytoplasm, cell membrane, and cell wall**.
3. It is important to see that the cell membrane and cytoplasm completely fill the space within the cell wall.

4. Place a **10% salt solution** under the cover slip. This is done by putting a drop of salt solution next to one edge of the cover slip, then absorbing water from the **opposite** side of the slip using a paper towel.
5. Observe the cells in the **SALT** solution. It is important to see that the **cytoplasm and cell membrane have SHRIVELED** up inside the cell wall. This is due to water molecules **leaving** the cell and entering the salty (low water) solution.

6. Place distilled water under the cover slip using the technique described in #4 above.
7. Observe the cells in **DISTILLED** water. It is important to see that the cytoplasm and cell membrane have **SWOLLEN** back to fill the entire space available within the cell wall.
8. **SALT SHRINKS – DISTILLED SWELLS**

What You Learned

1. Cells placed in very **salty** solutions will lose water, causing them to **shrink** and possibly lose the ability to complete life functions.
2. Cells placed in very **watery** solutions will tend to **gain** water, which causes them to **swell** and might cause them to burst/break open, destroying the cell. Note that this did not happen in the plant cells because the **cell wall** prevents the cell membrane from easily expanding.
3. Freshwater creatures, particularly single-celled organisms, must cope with too much water entering the cells. Saltwater organisms tend to have the opposite problem and must try to reclaim lost water.

Density and Moisture Content Measurements by Nuclear Methods L. F. Ballard,Robin P. Gardner,1965 Data is provided from an evaluation of the accuracy of the nuclear gages in comparison with the currently used non nuclear methods of determining soil density and moisture content The research study was principally theoretical in nature and was conducted in two parts with each part respectively considering density and moisture content Two existing commercial gages were evaluated and a nominal experimental program employing non soil standards of known density and composition was conducted to verify the density results The results of the moisture content study were checked against data in the literature
