Neuron Structure of the Brain Grigoriĭ Izrailevich Poliakov,1972 **Neuron Structure of the Brain** Grigoriĭ Izrailevich Poliakov,1972 **Neuron Structure of the Brain** Grigoriĭ Izrailevich Poliakov,1972 **Neuron Structure of the Brain** Grigoriĭ Izrailevich Poliakov,1972 *The Generalized Vertebrate Neuron* David Bodian,1962 Neuron Structure-function Correspondence as Revealed by Biological Scaling Theory Paheli Desai-Chowdhry,2023

Neurons are connected by complex branching processes that collectively process information for organisms to respond to their environment. Classifying neurons according to differences in structure or function is a fundamental piece of neuroscience. Here, by constructing new biophysical theory and testing against our empirical measures of branching structure, we establish a correspondence between neuron structure and function as mediated by principles such as time or power minimization for information processing as well as spatial constraints for forming connections. Based on these principles, we use Lagrange multipliers to predict scaling ratios for axon and dendrite sizes across branching levels. We test our predictions for radius scale factors against those extracted from images measured for species that range from insects to whales. Notably, our findings reveal that the branching of axons and peripheral nervous system neurons is mainly determined by time minimization, while dendritic branching is mainly determined by power minimization. Further comparison of different dendritic cell types reveals that Purkinje cell dendrite branching is constrained by material costs, while motoneuron dendrite branching is constrained by conduction time delay. We extend this model to incorporate asymmetric branching, where there are multiple different paths from the soma to the synapses, and thus multiple interpretations of conduction time delay: one considers the optimal path, and the other considers the sum of all possible paths, leading to different predictions. We find that the data for motoneurons show a distinction between the asymmetric and symmetric branching junctions corresponding to predictions using different interpretations of the time delay constraint. Moreover, the more asymmetric branching junctions are localized near the synapses, indicating that different functional principles affect the structure at different regions of the cell. Finally, we use machine learning methods to classify cell types using functionally relevant structural parameters derived from our model. Incorporating branching level as a feature in classification, in addition to parameters related to information flow, improves performance across methods, suggesting that information flow drives localized differences in morphology. Future directions of this work include estimating specific parameters related to functional tradeoffs and myelination using numerical optimization and analyzing changes across stages of development.

Neuronal Structure and Function Sydney Cash,1998 New Aspects of Axonal Structure and Function Dirk Feldmeyer,Joachim Lübke,2010-08-31 Axons are neuronal output elements and are responsible for the transfer and processing of signals from one neuron to another even over very large distances For a given neuronal cell type axons are unique and display very heterogeneous patterns with respect to shape length and target structure Axons are the usually long process of a nerve fiber that generally conducts impulses away from the body of the nerve cell This book is intended to summarize recent findings covering morphological physiological developmental computational and pathophysiological aspects of axons It attempts to cover new findings concerning axonal structure and functions together with their implications for signal transduction processes implicated in the formation of axonal arbors and the transport of subcellular elements to

their targets and finally how a dysfunction in one or several of these steps could lead to axonal degeneration and ultimately to neurodegenerative diseases

The Neuron Irwin B. Levitan, Kaczmarek Levitan, Leonard K. Kaczmarek, Founding Chair of the Department of Neuroscience Irwin B Levitan, Ph.D., 1997 Intended for use by advanced undergraduate graduate and medical students The Neuron Cell and Molecular Biology is an intriguing study of the unique biochemical and physiological properties of neurons which emphasizes the molecular mechanisms that generate and regulate their activity Keeping abreast of the enormous advances in neuroscience in the five years since the first edition was published the authors have revised all their chapters in the second edition What was formerly the first chapter has been expanded substantially and divided into two separate chapters to emphasize the cell biology of neurons and glia and their commonalities with other kinds of cells The section on intracellular communication has also been expanded and reorganized Levitan and Kaczmarek introduce the concept of ion channels as specialized membrane proteins at an early stage making the idea of selective membrane permeability more accessible in terms of the properties of specific ion channel proteins In addition they emphasize the astonishing diversity of voltage dependent ion channels that has become evident in recent years and discuss the implications of this diversity for neuronal physiology In the section on intercellular communication the chapter on neurotransmitter secretion has also been rewritten to reflect the new level of understanding of secretion that has resulted from the identification of many of the molecular players in vesicle fusion and exocytosis The other chapters in this section have also been fully revised to incorporate new information resulting from the cloning and characterization of the multitude of glutamate receptors as well as to describe novel elements of intracellular signaling pathways in neurons and other cells Finally the last section has been substantially updated to reflect the recent successes of molecular studies of

development and plasticity As more and more of the molecular entities that are essential for neuronal development and adult plasticity are identified and characterized phenomena that previously could be studied only at the descriptive level can now be explained in greater depth

Neural Organization Michael A. Arbib, Peter R. Erdi, János Szentágothai, 1998 In Neural Organization Arbib Erdi and Szentágothai integrate structural functional and dynamical approaches to the interaction of brain models and neurobiological experiments Both structure based bottom up and function based top down models offer coherent concepts by which to evaluate the experimental data The goal of this book is to point out the advantages of a multidisciplinary multistrategied approach to the brain Part I of Neural Organization provides a detailed introduction to each of the three areas of structure function and dynamics Structure refers to the anatomical aspects of the brain and the relations between different brain regions Function refers to skills and behaviors which are explained by means of functional schemas and biologically based neural networks Dynamics refers to the use of a mathematical framework to analyze the temporal change of neural activities and synaptic connectivities that underlie brain development and plasticity in terms of both detailed single cell models and large scale network models In part II the authors show how their systematic approach can be used to analyze specific parts of the nervous system the olfactory system hippocampus thalamus cerebral cortex cerebellum and basal ganglia as well as to integrate data from the study of brain regions functional models and the dynamics of neural networks In conclusion they offer a plan for the use of their methods in the development of cognitive neuroscience
