Future Generation Information Technology Jung-Hyun Lee, Byeong-Ho Kang, Dominik Ślezak, 2010-11-26 As information technology IT becomes specialized and fragmented it is easy to lose sight that many topics have common threads and because of this advances in one's discipline may transmit to another The presentation of results between different disciplines encourages this interchange for the advancement of IT as a whole This volume comprises the selection of papers presented at the Second International Mega Conference on Future Generation Information Technology FGIT 2010 composed of the following 11 international conferences Advanced Software Engineering and Its Applications ASEA 2010 Bio Science and Bio Technology BSBT 2010 Control and Automation CA 2010 Disaster Recovery and Business Continuity DRBC 2010 Database Theory and Application DTA 2010 Future Generation Communication and Networking FGCN 2010 Grid and Distributed Computing GDC 2010 Multimedia Computer Graphics and Broadcasting MulGraB 2010 Security Technology SecTech 2010 Signal Processing Image Processing and Pattern Recognition SIP 2010 as well as u and e Service Science and Technology UNESST 2010 In total 1 630 papers were submitted to FGIT 2010 from 30 countries The submitted papers went through a rigorous reviewing process and 395 papers were accepted Of these 395 papers 60 were assigned to this volume In addition this volume contains 7 invited papers

and abstracts Of the remaining accepted papers 269 were distributed among 8 volumes of proceedings published by Springer in the CCIS series 66 papers were withdrawn due to technical reasons *Synchronization and Arbitration in Digital Systems* David J. Kinniment,2008-02-28 Today s networks of processors on and off chip operating with independent clocks need effective synchronization of the data passing between them for reliability When two or more processors request access to a common resource such as a memory an arbiter has to decide which request to deal with first Current developments in integrated circuit processing are leading to an increase in the numbers of independent digital processing elements in a single system With this comes faster communications more networks on chip and the demand for more reliable more complex and higher performance synchronizers and arbiters Written by one of the foremost researchers in this area of digital design this authoritative text provides in depth theory and practical design solutions for the reliable working of synchronization and arbitration hardware in digital systems The book provides methods for making real reliability measurements both on and off chip evaluating some of the common difficulties and detailing circuit solutions at both circuit and system levels

Synchronization and Arbitration in Digital Systems also presents mathematical models used to estimate mean time between failures in digital systems a summary of serial and parallel communication techniques for on chip data transmission explanations on how to design a wrapper for a locally synchronous cell highlighting the issues associated with stoppable clocks an examination of various types of priority arbiters using signal transition graphs to show the specification of different designs from the simplest to more complex multi way arbiters including ways of solving problems encountered in a wide range of applications essential information on systems composed of independently timed regions including a discussion on the problem of choice and the factors affecting the time taken to make choices in electronics With its logical approach to design methodology this will prove an invaluable guide for electronic and computer engineers and researchers working on the design of digital electronic hardware Postgraduates and senior undergraduate students studying digital systems design as part of their electronic engineering course will struggle to find a resource that better details the information given inside this book **Software Engineering** Emmanuel Girard,1984 *Anatomy of a Silicon Compiler* Robert W.

Brodersen,2012-12-06 A silicon compiler is a software system which can automatically generate an integrated circuit from a user s specification Anatomy of a Silicon Compiler examines one such compiler in detail covering the basic framework and design entry the actual algorithms and libraries which are used the approach to verification and testing behavioral synthesis tools and several applications which demonstrate the system s capabilities *Technical Reports Awareness Circular : TRAC.*

Augustin,David C. Luckham,Benoit A. Gennart,Youn Huh,A. Stanculescu,2012-12-06

The VHSIC Hardware Description Language VHDL provides a standard machine processable notation for describing hardware VHDL is the result of a collaborative effort between IBM Intermetrics and Texas Instruments sponsored by the Very High Speed Integrated Circuits VHSIC program office of the Department of Defense beginning in 1981 Today it is an IEEE standard 1076 1987 and several simulators and other automated support tools for it are available commercially By providing a standard notation for describing hardware especially in the early stages of the hardware design process VHDL is expected to reduce both the time lag and the cost involved in building new systems and upgrading existing ones VHDL is the result of an evolutionary approach to language development starting with high level hardware description languages existing in 1981 It has a decidedly programming language flavor resulting both from the orientation of hardware languages of that time and from a major requirement that VHDL use Ada constructs wherever appropriate During the 1980 s there has been an increasing current of research into high level specification languages for systems particularly in the software area and new methods of utilizing specifications in systems development This activity is worldwide and includes for example object oriented design various rigorous development methods mathematical verification and synthesis from high level specifications VAL VHDL Annotation Language is a simple further step in the evolution of hardware description languages in the direction of applying new methods that have developed since VHDL was designed **Processor Architecture** Jurij Silc,Borut Robic,Theo Ungerer,2012-12-06 Today's microprocessors are the powerful descendants of the von Neumann 1 computer dating back to a memo of Burks Goldstine and von Neumann of 1946 The so called von Neumann architecture is

characterized by a sequential control flow resulting in a sequential instruction stream A program counter addresses the next instruction if the preceding instruction is not a control instruction such as e g jump branch subprogram call or return An instruction is coded in an instruction format of fixed or variable length where the opcode is followed by one or more operands that can be data addresses of data or the address of an instruction in the case of a control instruction The opcode defines the types of operands Code and data are stored in a common storage that is linearly addressed in units of memory words bytes words etc The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage The most simple implementation of a von Neumann computer is characterized by a microarchitectural architecture that defines a closely coupled control and arithmetic logic unit ALU a storage unit and an I/O unit all connected by a single connection unit The instruction fetch by the control unit alternates with operand fetches and result stores for the ALU
