MMS Daniel Ralph,Paul Graham,2004-04-21 MMS has evolved from the huge popularity of the SMS text service for GSM networks It is a departure from the transport mechanism used for SMS which is based on the GSM signalling channels to the use of IP to transport messages within the MMS network To this end MMS has similarities with Internet email and standard IETF protocols As with any new technology it is difficult to accurately predict the position within the next 5 years although based on previous experience with WAP and SMS it would be fair to say that these protocols will increase in usage over the next 5 years and become legacy for a further 5 years following which users will migrate onto the next wave of messaging Significant revenue growth and data usage is expected to be driven by consumer usage of MMS But MMS technology offers more than just a broadening of message content With MMS it is not only possible to send your multimedia messages from one phone to another but also from phone to email and vice versa This feature dramatically increases the possibilities of mobile communication both for private and corporate use Multimedia messaging will reshape the landscape of mobile communication making it more personal more versatile and more expressive than ever before MMS Is the first book to address how MMS and the use of IP to transport messages will affect existing infrastructure and business models Covers the fundamental changes to mail and billing systems Includes future recommendations such as interoperability and evolution

Presents an overview of the MMS technology components Drawing on the authors hands on experience in the implementation of MMS technology developing billing and delivering services at BT this innovative book will appeal to engineering managers network operators market analysts business decision makers content providers and operator organizations

Ubiquitous Mobile Information and Collaboration Systems Luciano Baresi, Schahram Dustdar, Harald Gall, Maristella Matera, 2005-03-01 Over recent years most business processes have changed in various dimensions e g exibility interconnectivity coordination style autonomy due to market conditions organizational models and usage scenarios of information systems Frequently information is relocated within a geographically distributed system according to rules that are only seldom defined as a well coded business process This creates the need for a software infrastructure that enables ubiquitous mobile and collaboration systems UMICS The anywhere anytime any means paradigm is becoming the major challenge in conceiving designing and releasing next generation information systems New technologies like wi networks and 3rd generation

mobile phones are offering the infrastructure to conceive of information systems as ubiquitous information systems that is systems that are accessible from anywhere at any time and with any device Ubiquity is not yet another buzzword pushed by emerging technologies but is mainly a means to support new business models and encourage new ways of working This new wave of UMICS will exploit the knowledge developed and deployed for conventional information systems but will also need new concepts models methodologies and supporting technologies to fully exploit the potentials of the enabling infrastructure and to be ready for the challenge Moreover people need to move across organizational boundaries and collaborate with others within an organization as well as between organizations The ability to query the company's distributed knowledge base and to cooperate with co-workers is still a requirement but mobility brings new access scenarios and higher complexity
