Excerpt from The Design and Construction of Steam Turbines A Manual for the Engineer Mr Alexander Richardson procured for the author complete data of important turbine tests which have proved invaluable TO Mr W Chilton and Mr J M Newton B Se Of the Brush Electrical Engineering Company a special meed Of thanks is due for the results Of some Of their

experiments on blading The general scheme of this volume was decided on after much consideration and the author finally adopted the plan of giving without prior proof important rules and formulas in a shape convenient for immediate practical application The demonstrations are proceeded with later in the belief that they will be the more readily followed by the average reader when he has previously been impressed with the utility of the result About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works Steam Turbines James Ambrose Moyer, 1929 **The Design and Construction of Steam Turbines; a Manual for the Engineer** Harold Medway Martin, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1913 edition Excerpt to the extent of the clearance allowed at the thrust block which in the case of electric light units is from 2 to 5 mils Given the clearance the amount of leakage past the dummy can be estimated as follows Referring to Fig 70 the steam issues from between the first pair of rings with a considerable velocity and kinetic energy The whole of this is destroyed by internal friction before the steam reaches the second pair of rings which it does at a reduced pressure and augmented volume Between these it again expands acquiring kinetic energy which is again destroyed before the third pair of rings is reached This process being repeated at each pair it will be seen that almost the whole of the available energy of the steam is destroyed by internal friction and that it issues from between the last pair of rings with a velocity much less than that due to its complete expansion Subject to certain limitations detailed below the discharge through such a packing can be calculated by the formula where  $w$  denotes the weight discharged in pounds per second  $f$  the area available for flow in square feet  $p_t$  the initial absolute pressure in pounds per square inch and  $V_1$  the initial specific volume of the steam whilst  $N$  denotes the number of points at which the steam is wire drawn and  $x$  where  $p$  denotes the absolute pressure  $P_t$  on final discharge from the last ring of the packing The formula can be established as follows Let the total energy available in 1 lb of steam expanding between the initial and final pressures be  $U$  heat units At each point of wire drawing a certain quantity of energy must be supplied to each pound of steam to create a velocity of flow let this be denoted by  $q_n$  heat units which as the steam increases The Design and Construction of Steam Turbines Harold Medway Martin, 2014-02 This is a reproduction of a book published before 1923 This book may have occasional imperfections such as missing or blurred pages poor pictures errant marks etc that were either part of the original artifact or were introduced by the scanning process We believe this work is culturally important and despite the imperfections have elected to bring it back into print as part of our continuing

Steam Turbines Hubert E. Collins, 2017-11-06 Excerpt from *Steam Turbines A Book of Instruction for the Adjustment and Operation of the Principal Types of This Class of Prime Movers* OF the making of books there is no end This seems especially true Of steam turbine books but the book which really appeals to the Operating engineer the man who may have a turbine unloaded set up put in operation and the builders representative out of reach before the man who is to operate it fully realizes that he has a new type of prime mover on his hands with which he has little or no acquaintance has not been written There has been much published both descriptive and theoretical about the turbine but so far as the writer knows there is nothing in print that tells the man on the job about the details Of the turbine in plain language and how to handle these details when they need handling The Operating engineer does not care why the moving buckets are made Of a certain curvature but he does care about the distance between the moving bucket and the stationary one and he wants to know how to measure that distance how to alter the clearance if necessary to prevent rubbing He doesn't care anything about the area Of the step bearing but he does want to know the way to get at the bearing to take it down and put it up again etc About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a
