The Frankencamera Eino-Ville Aleksi Talvala, 2011 Digital cameras, both in traditional form factors and as parts of cell phones, have become ubiquitous over the last decade. But for the most part, they remain black boxes to the end user and cannot be reprogrammed or modified. This has become an obstacle to researchers in the new field of computational photography, who want to use the growing computing power of digital cameras to create images no traditional camera could produce. This dissertation presents the Frankencamera platform, a digital camera system designed for computational photography. The Frankencamera is a fully open, fully programmable digital camera which can be easily modified to test out new research ideas. The Frankencamera architecture allows for per-frame control of the capture process and accurate synchronization of all the components that make up the camera. Based on this architecture, this dissertation details two hardware platforms: the F2, a flexible custom-built camera, and the Nokia N900, a commercial smartphone. Both platforms can be easily programmed at a high level using the FCam API, written to embody the Frankencamera architecture. Finally, this dissertation presents several sample applications for the Frankencamera platform. Several of these applications could not have been developed for any existing camera platform, and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography.

Ubiquitous Mobile Information and Collaboration Systems Luciano Baresi, Schahram Dustdar, Harald Gall, Maristella Matera, 2005-03-01 Over recent years most business processes have changed in various dimensions e.g. exhibility interconnectivity coordination style autonomy due to market conditions organizational models and usage scenarios of information systems Frequently information is relocated within a geographically distributed system according to rules that are only seldom defined as a well coded business process This creates the need for a software infrastructure that enables ubiquitous mobile and collaboration systems UMICS The anywhere anytime any means paradigm is becoming the major challenge in conceiving designing and releasing next generation information systems New technologies like wi networks and 3rd generation

mobile phones are offering the infrastructure to conceive of information systems as ubiquitous information systems that is systems that are accessible from anywhere at any time and with any device Ubiquity is not yet another buzzword pushed by emerging technologies but is mainly a means to support new business models and encourage new ways of working This new wave of UMICS will exploit the knowledge developed and deployed for conventional information systems but will also need new concepts models methodologies and supporting technologies to fully exploit the potentials of the enabling infrastructure and to be ready for the challenge Moreover people need to move across organizational boundaries and collaborate with others within an organization as well as between organizations The ability to query the company's distributed knowledge base and to cooperate with co-workers is still a requirement but mobility brings new access scenarios and higher complexity
