

# Mass Transport – Why is it needed?

- Diffusion is adequate for transport over small distances.
- Efficient supply of materials over larger distances requires a mass transport system.
- With increasing size, and decreasing surface area to volume ratio, the needs of the organism cannot be met by use of the body surface alone.
- Specialised exchange surfaces are located in specific regions of the body to allow absorption of nutrients and respiratory gases and the excretion of waste substances.
- Materials need to then be transported from the exchange sites to other areas of the body and to the external environment.
