Probability and Statistics for Engineering and the Sciences Jay L. Devore,1982 **Statistical Design and Analysis of Experiments** Robert L. Mason,Richard F. Gunst,James L. Hess,2003-05-09 Emphasizes the strategy of experimentation data analysis and the interpretation of experimental results Features numerous examples using actual engineering and scientific studies Presents statistics as an integral component of experimentation from the planning stage to the presentation of the conclusions Deep and concentrated experimental design coverage with equivalent but separate emphasis on the analysis of data from the various designs Topics can be implemented by practitioners and do not require a high level of training in statistics New edition includes new and updated material and computer output *Handbook of Mathematics for Engineers and Scientists* Andrei D. Polyanin,Alexander V. Manzhirov,2006-11-27 Covering the main fields of mathematics this handbook focuses on the methods used for obtaining solutions of various classes of mathematical equations that underlie the mathematical modeling of numerous phenomena and processes in science and technology The authors describe formulas methods equations and solutions that are frequently used in scientific and engineering applications and present classical as well as newer solution methods for various mathematical equations The book supplies numerous examples graphs figures and diagrams and contains many results in tabular form including finite sums and series and exact solutions of differential

integral and functional equations *Modeling Hydrologic Change* Richard H. McCuen, 2016-04-19 Modeling hydrologic changes and predicting their impact on watersheds is a dominant concern for hydrologists and other water resource professionals civil and environmental engineers and urban and regional planners As such changes continue it becomes more essential to have the most up to date tools with which to perform the proper analyses and m **Environmental Statistics and Data Analysis** Wayne R. Feature Selection for Knowledge Discovery and Data Mining Huan Liu, Hiroshi Motoda, 2012-12-06 As computer power grows and data collection technologies advance a plethora of data is generated in almost every field where computers are used The computer generated data should be analyzed by computers without the aid of computing technologies it is certain that huge amounts of data collected will not ever be examined let alone be used to our advantages Even with today's advanced computer technologies e.g. machine learning and data mining systems discovering knowledge from data can still be fiendishly hard due to the characteristics of the computer generated data Taking its simplest form raw data are represented in feature values The size of a dataset can be measured in two dimensions number of features N and number of instances P Both N and P can be enormously large This enormity may cause serious problems to many data mining systems Feature selection is one of the long existing methods that deal with these problems Its objective is to select a minimal subset of features according to some reasonable criteria so that the original task can be achieved equally well if not better By choosing a minimal subset of features irrelevant and redundant features are removed according to the criterion When N is reduced the data space shrinks and in a sense the data set is now a better representative of the whole data population If necessary the reduction of N can also give rise to the reduction of P by eliminating duplicates

Stormwater Management for Smart Growth Allen P. Davis, Richard H. McCuen, 2005-12-06 Land development to support population increases and shifts requires changes to the hydrologic cycle Increased impervious area results in greater volumes of runoff higher flow velocities and increased pollutant fluxes to local waterways As we learn more about the negative impacts of these outcomes it becomes more important to develop and manage land in a smart manner that reduces these impacts This text provides the reader with background information on hydrology and water quality issues that are necessary to understand many of the environmental problems associated with land development and growth The variability of runoff flows and pollutant concentrations however makes the performance of simple technologies erratic and predicting and modeling their performance difficult Chapters on statistics and modeling are included to provide the proper background and tools The latter

chapters of the text cover many of the different technologies that can be employed to address runoff flows and improve water quality. These chapters take a design approach with specific examples provided for many of the management practices. A number of methods are currently available for addressing the problems associated with stormwater runoff quality from urban areas; more continue to be developed as research is advanced and interest in this subject continues to surge. Traditionally, techniques for the improvement of runoff quality were borrowed applications from water and wastewater treatment such as large sedimentation ponds. Recently, increased interest has been placed on using natural systems to improve water quality.
