

Solutions, Suspensions, and Colloids Lab

Objective: To observe various mixtures and identify them as a solution, suspension, or colloid

Material: sucrose, soluble starch, clay, food coloring, salt, cooking oil, gelatin, vinegar, flashlight

Theory: Three different types of mixtures can be identified by using a beam of light to illustrate the Tyndall Effect. If the mixture is transparent and the Tyndall Effect is not seen, the mixture is a solution. If the mixture shows a Tyndall Effect and does not settle, the mixture is a colloid. If the mixture shows the Tyndall Effect and settles, it is a suspension. *(When a beam of light passes through a colloid, the beam is visible and appears as a ray passing through the material. Inside the container of a colloid, a light beam is visible as a set path. When a beam of light passes through a true solution, the beam is not visible when passing through the material. Inside the container of a solution, the beam is not visible as a set path.)*

Procedure:

1. Describe each mixture by placing your observations in the data table under "appearance".
2. Shine a flashlight through each mixture and observe what happens. The Tyndall Effect will either be present or not present. (Refer to the theory section above for further explanation.)
3. Based on procedure steps 1 and 2, classify the mixtures as solutions, suspensions, or colloids. (Refer to the theory section above for further explanation.)
4. Complete the reasoning column in the data table by explaining why you chose the classification that you did for each mixture.

Observation Table:

Mixture	Appearance	Tyndall Effect?	Classification	Reasoning
Sucrose + H ₂ O				
Starch + H ₂ O				
Clay + H ₂ O				
Food Coloring + H ₂ O				
Salt Water				
Cooking Oil
