Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders between two groups of nurses working in different departments of a hospital. The study included 100 nurses from the intensive care unit (ICU) and 100 nurses from the medical-surgical department. Data were collected through a self-administered questionnaire. The results showed that the prevalence of musculoskeletal disorders was higher among ICU nurses than among medical-surgical nurses. This finding suggests that the work environment in the ICU may contribute to a higher risk of developing musculoskeletal disorders.
