Plate Tectonics Reading and Comprehension

Directions: Read the following passage and answer the questions that follow.

Plate tectonics is the scientific theory that explains the movement of Earth's lithosphere, which is made up of large pieces called tectonic plates. These plates are not fixed; they are constantly moving, albeit very slowly. This movement is driven by the heat generated from the Earth's interior.

Types of Tectonic Plates: Earth's lithosphere is divided into several tectonic plates. The major ones include the Pacific Plate, North American Plate, Eurasian Plate, and South American Plate.

Plate Boundaries: The edges of tectonic plates are where significant geological activity occurs. There are three main types of plate boundaries: divergent, convergent, and transform.

Divergent Boundaries: At divergent boundaries, plates move away from each other. This creates gaps, and magma rises from the Earth's mantle to fill the space, leading to the formation of new crust. The Mid-Atlantic Ridge is an example.

Convergent Boundaries: At convergent boundaries, plates move towards each other. Depending on the types of plates involved, this can result in subduction (one plate going beneath the other) or collision. Subduction zones often lead to the creation of deep ocean trenches.

Transform Boundaries: At transform boundaries, plates slide past each other horizontally. This movement can cause earthquakes along fault lines. The San Andreas Fault in California is an example of a transform boundary.

1. What is plate tectonics, and what are the plates made of?
2. Name two major tectonic plates mentioned in the passage.
3. What happens at divergent boundaries, and can you provide an example mentioned in the passage?
4. Describe what occurs at convergent boundaries and provide an example.
5. Explain what happens at transform boundaries and give an example mentioned in the passage.
