The Physics Of Supernovae And Their Mathematical

Models Alexey G Aksenov, Valery Mihailovich Chechetkin, 2024-03-06 This book is dedicated to the theory of supernovae focusing on new computational methods and simulations It contains three parts basic principles numerical methods and applications The first part contains a non formal introduction into the basics of supernovae Boltzmann kinetic equations with details of two particles reaction rate calculations and the transformation of Boltzmann kinetic equations into hydrodynamic elements of statistical physics It also contains the equation of state for matter of high energy density with details of calculations for thermodynamic parameters weak interactions reaction rate details and thermonuclear burning The second part introduces elements of computational physics The book closes with a presentation of original thought regarding the regime of burning in degenerate carbon oxygen cores a neutrino transport in Type II supernovae a simulation of general relativity GR coalescence of neutron stars aspherical nucleosynthesis in a core collapse supernova and thermalization in a pair of plasma winds from a compact strange star This book brings together generally accepted simulations methods as well as original material written by two respected members of Russian research groups the Keldysh Institute of Applied Mathematics and Institute of Theoretical and Experimental Physics It contains the necessary information for a person to start independent research in this fast developing field and is therefore an important read for new researchers in this subject

High order summation-by-parts based approximations for discontinuous and nonlinear problems Cristina La Cognata, 2017-09-14 Numerical approximations using high order finite differences on summation by parts SBP form are investigated for discontinuous and fully nonlinear systems of partial differential equations Stability and conservation properties of the approximations are obtained through a weak imposition of interface and boundary conditions with the simultaneous approximation term SAT technique The SBP SAT approximations replicate the continuous integration by parts rule From this property well posedness and integral properties of the continuous problem are mimicked and energy estimates leading to stability are obtained The first part of the thesis focuses on the simulations of discontinuous linear advection problems An artificial interface is introduced separating parts of the spatial domain characterized by different wave speeds A set of flexible stability conditions at the interface are derived which can be adapted to yield conservative or non conservative approximations This model can be interpreted as a simplified version of nonlinear problems involving jumps at shocks or as a prototypical of wave propagation through different materials In the second part of the thesis the vorticity stream function formulation of the nonlinear momentum equation for an incompressible inviscid fluid is considered SBP operators are used to derive a new Arakawa like Jacobian with mimetic properties by combining different consistent approximations of the convection terms Energy and enstrophy conservation is obtained for periodic problems using schemes with arbitrarily high order of accuracy These properties are crucial for long term numerical calculations in climate and

weather forecasts or ocean circulation predictions The third and final contribution of the thesis is dedicated to the incompressible Navier Stokes problem First different completely general formulations of energy bounding boundary conditions are derived for the nonlinear equations The boundary conditions can be used at both far field and solid wall boundaries The discretisation in time and space with weakly imposed initial and boundary conditions using the SBP SAT framework is proved to be stable and the divergence free condition is approximated with the design order of the scheme Next the same formulations are considered in a linearised setting whereupon the spectra associated with the initial boundary value problem and its SBP SAT discretisation are derived using the Laplace Fourier technique The influence of different boundary conditions on the spectrum and in particular the convergence to steady state is studied **Dense+Green Urban**
