Revankar,2023-03-03 Fast Reactions in Energetic Materials Alexander S. Shteinberg,2008-09-26 Modern energetic materials include explosives blasting powders pyrotechnic m tures and rocket propellants 1 2 The study of high temperature decomposition of condensed phases of propellants and their components liquid solid and hybrid is currently of special importance for the development of space system engineering 3 4 To better understand the burning mechanisms stationary nonstationary steady of composite solid propellants and their components information about the macrokinetics of their high temperature decomposition is required 5 To be able to evaluate the ignition parameters and conditions of safe handling of heat affected explosives one needs to know the kinetic constants of their high temperature composition The development of new composite solid propellants characterized by high

performance characteristics high burning rates high thermal stability stability to intrachamber perturbations and other aspects is not possible without quantitative data on the high temperature decomposition of composite solid propellants and their components 6 The same reasons have resulted in significant theoretical and practical interest in the high temperature decomposition of components of hybrid propellants It is known that hybrid propellants have not been used very widely due to the low burning pyrolysis rates of the polymer blocks in the combustion chambers of hybrid rocket engines To increase the burning rates it is necessary to obtain information about their relationships to the corresponding kinetic and thermophysical properties of the fuels
