

- **Electromagnets:** A solenoid with a ferromagnetic core (e.g., iron). The core intensifies the magnetic field.
- **Factors Affecting Electromagnet Strength:**
 - Number of turns in the coil.
 - Amount of current flowing through the wire.
 - Permeability of the core material (ferromagnetic cores increase strength).
- **Applications of Electromagnets:** Motors, generators, doorbells, MRI machines, lifting heavy objects, etc.

V. Magnetic Force on Moving Charges and Current-Carrying Wires

- **Force on a Moving Charge:** A charged particle moving in a magnetic field experiences a magnetic force.
 - The force is **perpendicular** to both the velocity of the charge and the magnetic field direction.
 - The magnitude of the force depends on the charge, velocity, magnetic field strength, and the angle between the velocity and the field.
 - The direction of the force on a **positive** charge can be determined using the **right-hand rule** (thumb = velocity, index finger = magnetic field, middle finger = force). The force on a **negative** charge is in the opposite direction.
- **Force on a Current-Carrying Wire:** A wire carrying an electric current in a magnetic field also experiences a magnetic force because the current consists of moving charges.
 - The direction of the force can be determined using a similar **right-hand rule** (thumb = current direction, index finger = magnetic field, middle finger = force).
 - The magnitude of the force depends on the current, length of the wire in the field, magnetic field strength, and the angle between the current and the field ($F = ILB\sin\theta$).
