What Is Your Favorite Flavor?

Read the following paragraphs, and complete the exercises below.

The word *chromatography*, which describes a process for separating parts of a mixture, comes from the Greek words for “color writing.” Chromatography was originally used to separate colored plant pigments. Today, many industries use chromatography to separate mixtures.

HOW CHROMATOGRAPHY SAVES MONEY

Thanks to chromatography, foods with a greater variety of flavors are now available at a lower cost. In the past, all foods were flavored with natural compounds derived from plants. However, this process is often expensive, and supplies of the necessary plants are limited. Today, many of the chemical compounds that make up these flavorings are produced in the laboratory.

TESTING COMPLEX FLAVORINGS AND FRAGRANCES IN THE LAB

Some flavorings, such as the compound benzaldehyde—which is the flavoring of wild cherry—are fairly easy to make. However, creating flavorings that are made of many compounds is much more difficult. More than 100 compounds are sometimes found in a single flavoring! Researchers use gas chromatography to determine what compounds are in some flavorings so that they can make these flavors in the lab.

The same process is used to create artificial fragrances. In many cases, the synthetic compound is identical to the natural one, but it is much more affordable. For example, any fragrance that smells like roses contains beta-phenylethyl alcohol. It costs thousands of dollars per kilogram to extract this compound from rose oil, but it can be made in a laboratory for just 1 percent of this cost.

EXERCISES

1. What is chromatography?

2. Explain how gas chromatography helps scientists create complex flavors and fragrances in the laboratory.

3. What are two advantages of using synthetic compounds rather than natural ones for certain flavors and fragrances?

Papadakis,Michail Kalogiannakis,Ali Ibrahim Can Gözü,2023-03-13 Support for the conceptual design stage of effective and resource-efficient offerings Sergio Brambila,2020-10-20 Human activities in the form of production and consumption

have increased to an all time high In many cases this increase has resulted in environmental problems such as waste and pollution that in turn affect our health and way of living Societies have proposed different measures to address such environmental problems These range from different waste treatment technologies to alternative business models policy measures and lifecycle thinking in the design of products to mention but a few In this research the focus is on supporting early design activities of what is often called the conceptual design stage with the objective to provide effective and resource efficient offerings The early design activities considered here are planning analysis and evaluation Design researchers have largely supported these three activities with a variety of methods and tools However previous research has shown that design support coming from academia has had a low uptake in industry In this regard the aim of this research is to propose not only useful but also usable support for design practitioners during the conceptual design stage This research is carried out in the manufacturing sector in Sweden where selected companies expressed an interest in collaborating with academia to address more thoroughly effective and resource efficient offerings To better match company needs and research from academia this research took a pragmatic and cross disciplinary approach This research approach along with literature reviews semi structured interviews workshops and questionnaires shows different ways in which support can be made more useful and usable The main gap addressed here is that the knowledge and the related skills of the user of the support have not been

sufficiently explored The results include requirements of the user of the support proposed methods and tools derived from the requirements identified and most importantly the knowledge and skills needed by the user of the support The main message of this research is that support could be expanded from methods and tools to include knowledge and skills needed by design practitioners the users of support The flow of support from academia to industry could also be reinforced in a two way flow through a pragmatic and cross disciplinary approach to first and foremost address design practitioners needs M
