Frederik Dilling, Simon F. Kraus, 2022-07-01 Interdisciplinary teaching is considered as one of the main goals of education worldwide At the same time it poses an immense challenge to teachers who have been trained in only one of the combined subjects This is true even for closely related disciplines such as mathematics and physics In this volume practice oriented educational comparisons are made across various topics that are highly relevant in both subjects Furthermore practical examples are presented in the form of lesson plans in which exemplary implementation in class is presented considering both educational perspectives *Discrete Mathematics in the Schools* Joseph G. modelling provides a way of conceiving and resolving problems in the life world of people whether these range from the everyday individual numeracy level to sophisticated new problems for society at large Mathematical modelling and real world applications are considered as having potential for multi disciplinary work that involves knowledge from a variety of communities of practice such as those in different workplaces e g those of educators designers construction engineers museum curators and in different fields of academic endeavour e g history archaeology mathematics economics From an educational perspective researching the development of competency in real world modelling involves research situated in crossing the boundaries between being a student engaged in modelling or mathematical application to real word tasks in the classroom being a teacher of mathematical modelling in or outside the classroom or bridging both and being a modeller of the world outside the classroom This is the focus of many of the authors of the chapters in this book All authors of this volume are members of the International Community of Teachers of Mathematical Modelling ICTMA the peak research body into researching the teaching and learning of mathematical modelling at all levels of education from the early years to tertiary education as well as in the workplace

Machine Learning With School Level Math Swapnil Banerjee, Nivedita Majumdar, 2024-05-06 Machine learning a subset of artificial intelligence is one of the most transformative technologies of our time And yet machine learning and data exploration are minimally covered in the standard school curriculum *Machine Learning With School Level Math* brings you a compelling program with a brand new approach Our stance is that many elements of machine learning are completely accessible without the sophistication of advanced math and within the reach of middle to high school students All they need is the math they are already learning in school Developed collaboratively by a physicist with significant teaching experience including K 12 teaching experience and an algorithm development industry expert our program is a first of its kind effort to demystify the inner workings of machine learning at the school level Quick highlights

- 1 Prerequisites No advanced math or programming background is assumed
- 2 8 chapters 30 worksheets and more than 100 fully worked out pen and paper and computer problems
- 3 Learn Python programming with unique and innovative CodeTrailMaps From concepts of rate and slope the gradient descent algorithm GDA is developed and then the GDA is used to solve linear regression logistic regression and neural nets Composite functions part of current school course structures are used to introduce neural nets Through these models students learn a complete machine learning workflow including data normalization model selection finding model parameters using a pertinent cost function train test cycles and the construction of confusion matrices to evaluate model performance Ideas of dimensionality reduction with principal component analysis are also covered as one more application of GDA Basic Python programming is introduced seamlessly alongside the theory to deliver a thorough hands on experience A general audience curious about the fundamentals of machine learning will also find value in this book

Integrating Research on the Graphical Representation of Functions Thomas A. Romberg, Elizabeth Fennema, Thomas P. Carpenter, 2012-10-12 This volume focuses on the important mathematical idea of functions that with

the technology of computers and calculators can be dynamically represented in ways that have not been possible previously. The book's editors contend that as a result of recent technological developments combined with the integrated knowledge available from research on teaching, instruction, students' thinking, and assessment, curriculum developers, researchers, and teacher educators are faced with an unprecedented opportunity for making dramatic changes. The book presents content considerations that occur when the mathematics of graphs and functions relate to curriculum. It also examines content in a carefully considered integration of research that conveys where the field stands and where it might go. Drawing heavily on their own work, the chapter authors reconceptualize research in their specific areas so that this knowledge is integrated with the others' strands. This model for synthesizing research can serve as a paradigm for how research in mathematics education can and probably should proceed.

Learning from Computers: Mathematics Education and Technology Christine Keitel-Kreidt, Kenneth Ruthven, 2012-12-06

The NATO Advanced Research Workshop on Mathematics Education and Technology was held in Villard de Lans, France, between May 6 and 11, 1993. Organised on the initiative of the BaCoMET Basic Components of Mathematics Education for Teachers group, Christiansen, Howson, and Otte, 1986; Bishop, Mellin, Olsen, and van Dormolen, 1991, the workshop formed part of a larger NATO programme on Advanced Educational Technology. Some workshop members had already participated in earlier events in this series and were able to contribute insights from them; similarly, some members were to take part in later events. The problematic for the workshop drew attention to important speculative developments in the applications of advanced information technology in mathematics education over the last decade, notably intelligent tutoring, geometric construction, symbolic algebra, and statistical analysis. Over the same period, more elementary forms of information technology had started to have a significant influence on teaching approaches and curriculum content, notably arithmetic and graphic calculators, standard computer tools such as spreadsheets and databases, and computer-assisted learning packages and computer microworlds specially designed for educational purposes.

Technology-Assisted Guided Discovery to Support Learning Lisa Göbel, 2021-02-23

Technology is becoming more and more integrated in mathematics teaching, and the use of technology is explicitly demanded by the curricula. Technology can be, for example, integrated while conceptualizing parameters of quadratic functions. In this thesis, three technical visualizations: classic function plotter, drag mode, and sliders for the manipulation of parameters of quadratic functions, shall be compared with an access without the possibility of technical visualization. For this purpose, a Guided Discovery environment was developed, which was conducted in an intervention study with 14 classes of grade 9 (N = 383). Different strengths and weaknesses of the individual visualizations in favor of the dynamic visualizations by drag mode and slider are shown. Also, different potentials and constraints of the use of technology are visible. For example, the students use the technology to test their own hypotheses that were generated through the use of technology. The author, Lisa Göbel, completed her dissertation as a research assistant under Prof. Dr. Barbara Barzel in

the Mathematics Education department at the University of Duisburg Essen Her interests include functional thinking and the use of technology in mathematics teaching *Algebra 1* McDougal Littell Incorporated, Ron Larson, 2003
