Pioneering Solutions in Supply Chain Management Wolfgang Kersten, 2010 *Electronic Batch Recording Solutions* Monika Futschik, 2017-10-11

Monika Futschik introduces an evaluation model that allows a holistic assessment of the advantages and disadvantages of electronic batch recording solutions versus traditional paper batch ticket solutions. In comparison to former studies, this newly developed evaluation model considers the change management efforts and the financial investments required for system deployment. The model proves the overall performance value through the implementation of electronic batch recording solutions and supports decision makers in finding the most effective solution. The development and effectiveness of this model is based on various surveys, expert interviews, a Delphi study, as well as a case study with a real-life pharmaceutical company. The outcome of her research can be easily applied to other industries as well.

Holonic and Multi-Agent Systems for Manufacturing Vladimir Marik, Robert W. Brennan, Michal Pechoucek, 2005-08-29 The challenge faced in today's manufacturing and business environments is the question of how to satisfy increasingly stringent customer requirements while managing growing system complexity. For example, customers expect high quality, customizable, low cost products that can be delivered quickly. The systems that deliver these expectations are by nature distributed, concurrent, and stochastic, and as a result, increasingly difficult to manage. Unfortunately, the traditional hierarchical, strictly centralized approach to control used in these domains is characteristically inflexible, fragile, and difficult to maintain. These shortcomings have led to the development of a new class of manufacturing and supply chain decision making approaches in recent years. Solutions based on these approaches usually explore a set of highly distributed decision making units that are capable of autonomous operations while cooperating interactively to resolve larger problems. The units referred to as agents in classical computer science and software engineering, or holons if physically integrated with the manufacturing hardware, interact by exchanging information. These units are motivated by arriving at local solutions as well as collaborating and sharing resources and goals in solving the overall problem in question collectively.
