

10. The file will be executed.
11. It is often essential to have someone who can do things that are normally forbidden. For example, a user starts up a job that generates an infinite amount of output. The user then logs out and goes on a three-week vacation to London. Sooner or later the disk will fill up, and the superuser will have to manually kill the process and remove the output file. Many other such examples exist.
12. Any file can easily be named using its absolute path. Thus getting rid of working directories and relative paths would only be a minor inconvenience. The other way around is also possible, but trickier. In principle if the working directory is, say, */home/clust/projects/research/proj1* one could refer to the password file as *././././etc/passwd*, but it is very clumsy. This would not be a practical way of working.
13. The process table is needed to store the state of a process that is currently suspended, either ready or blocked. It is not needed in a single process system because the single process is never suspended.
14. Block special files consist of numbered blocks, each of which can be read or written independently of all the other ones. It is possible to seek to any block and start reading or writing. This is not possible with character special files.
15. The read works normally. User 2's directory entry contains a pointer to the i-node of the file, and the reference count in the i-node was incremented when user 2 linked to it. So the reference count will be nonzero and the file itself will not be removed when user 1 removes his directory entry for it. Only when all directory entries for a file have been removed will its i-node and data actually vanish.
16. No, they are not so essential. In the absence of pipes, program 1 could write its output to a file and program 2 could read the file. While this is less efficient than using a pipe between them, and uses unnecessary disk space, in most circumstances it would work adequately.
17. The display command and response for a stereo or camera is similar to the shell. It is a graphical command interface to the device.
18. Windows has a call `spawn` that creates a new process and starts a specific program in it. It is effectively a combination of `fork` and `exec`.
19. If an ordinary user could set the root directory anywhere in the tree, he could create a file *etc/passwd* in his home directory, and then make that the root directory. He could then execute some command, such as *su* or *login* that reads the password file, and trick the system into using his password file, instead of the real one.
