

Pronghorn Ventilator 2 ventilator with adult valve attached (blue arrow). The flow (yellow arrow) is connected to the bag port of an anaesthesia breathing system. Breathing is controlled by a pressure vent (green arrow).

Master Small Animal Ventilator (Puritan, Bennett Service)

The inspiratory flow rate can be set to between 200 and 250 and 25 litres/min. As the airway pressure and volume delivered are measured, compliance is calculated and displayed. A PEEP value is also easy to set with this ventilator.

Infant Ventilator series 200 ventilator with an adult valve attached (blue arrow). Ventilator with flow sensing (yellow arrow) should connect the ventilation to the bag port of the breathing system (a pressure drive gas flow during the inspiratory phase). Flow gas can be used for gas flow sensing (a pressure drive gas flow during the inspiratory phase). Infant Ventilator series 200 ventilator with an adult valve attached (a blue arrow) is connected to the bag port of the circuit. The circuit's gas off valve is closed, and breathing is achieved via the exhaust valve (green arrow) at the ventilator.

Bed-mounted Black T ventilator. The inspiratory pressure control layer (blue arrow) is used to set the pressure for both tidal and total inspiration, which helps to determine the tidal volume delivered. The sensitivity control (black arrow) can be set to place the actual volume delivered against the patient's own breathing effort. The pressure control layer can be used to determine whether ventilation is being or fully controlled. The inspiratory flow rate control (yellow arrow) sets the flow for every adult fully inflated 'breath', which effectively turns the ventilation off. Another adult 'breath' control, which controls respiratory time, will also effectively turn the ventilation off if the inspiratory time is greatly lengthened.

An inspiratory assist control, which covers a range of pressures between -1 and -20 cmH₂O, allows breathing from the ventilator. The system also has audible alarms and on-screen displays to alert the operator to the case of disconnection or overpressure. In the event of power failure, all valves open to allow manual IPPV.

Bed ventilators

First generation Black T ventilators are one of a series of pneumatically powered ventilators that can be used to ventilate intensive care patients directly, or anaesthetised patients by driving a bellows in a bubble or the same way as the 241-Black Rigor Ventilator. Bed ventilators can be time-, pressure- or manually triggered and are pressure-cycled. Peak inspiratory pressure is set to cycle and limit the inspiratory phase and, therefore, along with the patient's respiratory system characteristics, determines the delivered tidal volume. A pneumatically driven expiratory timing device helps to control the ventilation rate. Trigger sensitivity can be set for patient-triggered breaths. Inspiratory flow can be controlled and will also affect the ventilation rate and PEEP rate.

When the air-way system is pushed on, oxygen from the anaesthetic machine is delivered to the patient. A rectangular waveform showing a constant flow pattern is produced throughout inspiration with an increasing pressure waveform (see Part 1). With the air-way control pulled out, air can be obtained via a Venturi, so that flow from 50% per cent oxygen is delivered to the patient. A decelerating flow pattern is produced, with a variable flow rate, depending on the patient's respiratory system compliance and resistance.

SUMMARY

This two-part article has aimed to describe some of the medical technology surrounding ventilation and mechanical ventilators. Hopefully, the information will help general practitioners build up their confidence in managing those patients requiring ventilatory support and selecting the most appropriate ventilator and ventilator settings.
