Fundamentals of Electromagnetics with Engineering Applications Stuart M. Wentworth, 2005

Coherent Light-Matter Interactions in Monolayer Transition-Metal Dichalcogenides Edbert Jarvis Sie, 2017-11-11 This thesis presents optical methods to split the energy levels of electronic valleys in transition metal dichalcogenides TMDs by means of coherent light matter interactions The electronic valleys found in monolayer TMDs such as MoS₂ WS₂ and WSe₂ are among the many novel properties exhibited by semiconductors when thinned down to a few atomic layers and have have been proposed as a new way to carry information in next generation devices so called valleytronics These valleys are however normally locked in the same energy level which limits their potential use for applications The author describes experiments performed with a pump probe technique using transient absorption spectroscopy on MoS₂ and WS₂ It is demonstrated that hybridizing the electronic valleys with light allows one to optically tune their energy levels in a controllable valley selective manner In particular by using off resonance circularly polarized light at small detuning one can tune the energy level of one valley through the optical Stark effect Also presented within are observations at larger detuning of a separate contribution from the so called Bloch Siegert effect a delicate phenomenon that has eluded direct observation in solids The two effects obey opposite selection rules enabling one to separate the two effects at two different valleys

Fundamentals of Photonics Bahaa E. A. Saleh, Malvin Carl Teich, 2007-03-09 Fundamentals of Photonics A complete thoroughly updated full color second edition Now in a new full color edition Fundamentals of Photonics Second Edition is a self contained and up to date introductory level textbook that thoroughly surveys this rapidly expanding area of engineering and applied physics Featuring a logical blend of theory and applications coverage includes detailed accounts of the primary theories of light including ray optics wave optics

Agrawal, 2010-07-28 The development of new highly nonlinear fibers referred to as microstructured fibers holey fibers and photonic crystal fibers is the next generation technology for all optical signal processing and biomedical applications This new edition has been thoroughly updated to incorporate these key technology developments The book presents sound coverage of the fundamentals of lightwave technology along with material on pulse compression techniques and rare earth doped fiber amplifiers and lasers The extensively revised chapters include information on fiber optic communication systems and the ultrafast signal processing techniques that make use of nonlinear phenomena in optical fibers New material focuses on the applications of highly nonlinear fibers in areas ranging from wavelength laser tuning and nonlinear spectroscopy to biomedical imaging and frequency metrology Technologies such as quantum cryptography quantum computing and quantum communications are also covered in a new chapter This book will be an ideal reference for R scientists involved with research on fiber amplifiers and lasers graduate students and researchers working in the fields of optical communications and quantum information The only book on how to develop nonlinear fiber optic applications Two new chapters on the latest developments Highly Nonlinear Fibers and Quantum Applications Coverage of biomedical applications **Birefringence and Bragg grating control in femtosecond laser written optical circuits** , 2012-12-31 In this thesis femtosecond lasers are explored for the fabrication of fiber Bragg gratings FBGs in suspended core fibers SCFs as well as direct writing of integrated optical devices in bulk fused silica glass The FBGs fabricated in suspended core fibers with different core geometries were demonstrated with femtosecond laser exposure through a Talbot interferometer In this case the use of a femtosecond laser system was crucial as it eliminates the need for the use of photosensitive fibers which is the case for SCFs while the Talbot interferometry setup provided flexibility in the definition of the grating periodicity while simultaneously protecting the optical components used in the fabrication process from the high intensities reached during exposure in the proximity of the fibers These Bragg gratings were employed to show simultaneous strain and temperature sensing Using a

femtosecond laser direct writing system novel point by point fabrication arrangements with detailed attention to the computer controlled laser beam modulation were developed in order to correctly introduce modulation of the refractive index profile during the waveguide fabrication process This technique enabled the development of phase and frequency control required for advanced Bragg grating waveguide BGW fabrication and arbitrary spectral shaping Procedures were demonstrated for the fabrication of chirped and phased shifted BGWs for applications in temporal pulse shaping and spectral shaping that showed significantly improved feature resolutions for sensing applications The BGWs were used as a practical sensitive tool to determine and study the waveguide birefringence inherent to the nonlinear absorption processes typical of femtosecond laser material interaction The control of form and stress birefringence was developed in order to accomplish the fabrication of integrated optical components for polarization control like guided wave retarders and polarization beam splitters Tuning of this waveguide birefringence was achieved by the introduction of stress inducing laser modification tracks that enabled the ability to both enhance or reduce the inherent birefringence Characterization techniques were developed for the absolute determination of the birefringence based on BGWs spectrum splitting together with crossed polarizer measurements while novel data analysis procedures were demonstrated for the study of polarization dependent and polarization independent directional couplers with the introduction of a polarization splitting ratio which is wavelength and coupling length dependent All of the improvements made in the understanding of waveguide birefringence control provided increased flexibility to simultaneously fabricate low polarization mode dispersion circuits as well as more efficient and compact polarization dependent devices The polarization aspects detailed here together with the point by point fabrication system may be further developed in the future towards the fabrication of more complex integrated devices that combine spectral temporal and polarization control all achievable with the same femtosecond laser writing system These flexible processing techniques will open new directions for writing additional functionalities in optical circuits with more compact three dimensional geometries
