

1. When a rod is held with a glass, a PVC, or a paper electrophorus plate (or any charged), the rod has been attracted by static forces. Even though the rod is being brought near, and the rod keeps its charge, right? (as predicted by a principle of conservation)

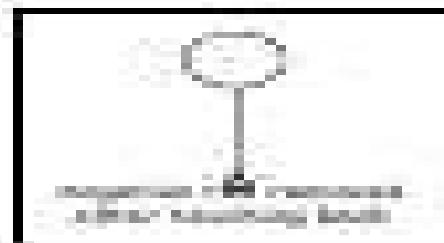

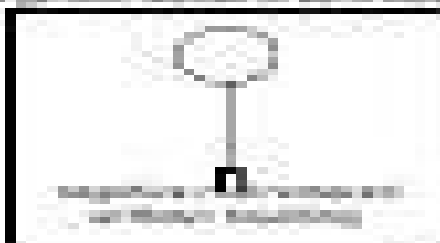

2. When the rod touches the metal sphere, after being moved to the left, positive charges distribute themselves uniformly over the entire rod and sphere, just as far as possible. In the first diagram, draw an arrow showing the direction the electrons move. When the rod is removed, the sphere is left with a net neg charge. This process is charging by conduction (or charging by contact). In the second diagram, draw the net charge on the sphere.

3. The following series involves a glass rod and charged rod. In each case, draw the arrangement that charge distribution has had.

4. Charging a metal sphere without touching is called induction. The side of the object closest to the charging distribution is charged that is (like same as, opposite) that side the charging rod. This process is charging by induction (or charging by induction).

5. Draw the forces on the electrophorus holder, and use it positive and it negative charges to draw the charge distribution in each case.

Method for Measuring Static Potential on Moving Fabrics ,2004 There is no clear explanation for static potential generation There are many factors that affect charge generation such as environment temperature humidity structural polymer type structure of fabric and working factors fabric speed tension and contact area between fabric and machine parts material type that is in contact with fabric With a good knowledge of these parameters generation of static charge can be minimized During production static potential on a moving web can cause web breakage ignition of flammable atmosphere or shock risk The main objective of this research is to develop a method to measure static electricity on moving nonwoven machine belts In this project the instruments to measure and eliminate static potential on moving fabrics design of test apparatus relationship between charge decay values and charge generation of different fabrics static potential measurements under different conditions are discussed Spunbond technology is one of the nonwoven production methods have a high static charge generation problem tests were done by using a spunbond belt on an actual spunbond machine These belts are mostly made of woven fabrics with different structures different number of layers fabric design structure of polymers used A goal of manufacturing these belts is to reduce static electricity during production Among all parameters that cause static charge generation tension is the most important one A small amount of increase in tension can double the charge on belt Separation is also a reason for charge generation and as roller fabric friction increases because of the increased contact area more charge will be generated during separation A new parameter contact area also needs to be considered Static charge generation may not be same at cross direction on a belt As all areas are in the same situation working and environment conditions the only thing that was different was the tension Because of the spunbo

from one material to the other until an equilibrium is reached This transfer of electrons creates an imbalance of charges resulting in a buildup of positive charge on one object and an equal buildup of negative charge on the other Applications of Static Electricity Static electricity has a wide range of applications in various fields Some common applications include Photocopying Static electricity is used to transfer toner particles to paper in photocopying machines Air Filtration Electrostatic air filters use static electricity to remove dust and other particles from the air Electrostatic Painting Static electricity is used to attract paint particles to a surface resulting in a more uniform and durable finish Inkjet Printing Inkjet printers use static electricity to control the placement of ink droplets on paper Implications of Static Electricity While static electricity has many beneficial applications it can also have some negative implications Some common problems caused by static electricity include Electrostatic Discharge ESD ESD is a sudden flow of electrical charge between two objects ESD can damage electronic components and even cause fires Static Cling Static cling is the attraction between two objects caused by static electricity Static cling can be annoying and can even damage clothing Lightning Lightning is a natural phenomenon caused by the buildup of static electricity in the atmosphere Lightning can be dangerous and can cause damage to property and loss of life Explore the World of Static Electricity With its fascinating properties and wide range of applications static electricity is a force that touches many aspects of our lives In this book we will explore the fascinating world of static electricity covering a wide range of topics including its fundamental principles applications and implications in our daily lives We will also delve into the history of static electricity examining the experiments and discoveries that have led to our current understanding of this phenomenon Whether you are a student a scientist or simply someone who is curious about the world around you this book will provide you with a comprehensive and engaging introduction to the world of static electricity If you like this book write a review on google books *Practical Chapters on Static Electricity* Samuel H.
