

Problems 1 and 2 together illustrate that the graph of an “offspring” function of the parent cubic function  $y = x^3$  has only one  $x$ -intercept.

The graph of the cubic function  $y = x^3 - 2x^2 - 5x + 6$  has three  $x$ -intercepts. You cannot obtain this function or others like it by transforming the parent cubic function  $y = x^3$  using stretches, reflections, and translations.

Similarly, some quartic functions are simple transformations of  $y = x^4$  and some are not.
