Transition Metals 2 - Compounds and Reactions

To succeed in this topic you need to:

- Understand the principle of oxidation numbers.
- Understand types of bonding and molecular shapes.
- Understand the basics of Transition Metals (covered in Factsheet 38)

After working through this Factsheet you will:

- Have more experience of transition metal compounds;
- Recall the reactions of transition metal ions with hydroxides and ammonia;
- Recall the oxidation states of vanadium, and how they can be interconverted.

The following simple test tube reactions illustrate the behaviour of transition metal ions.

Addition of aqueous alkali to transition metal ions

Practical 1 – Addition of sodium hydroxide solution

Dilute sodium hydroxide solution is added dropwise to aqueous transition metal ions. Initially a precipitate is looked for, then the sodium hydroxide is added to excess to find out if the precipitate will eventually re-dissolve.

Ion	Addition of NaOH (aq)	Excess NaOH (aq)
Cr^{3+}	Green ppt	Green solution
Mn^{2+}	Buff ppt, darkens in air	Precipitate does not dissolve
Fe^{2+}	Pale green ppt, browns on surface	Precipitate does not dissolve
Fe^{3+}	Red brown ppt	Precipitate does not dissolve
Co^{2+}	Blue ppt, turns brown in air	Precipitate does not dissolve
Ni^{2+}	Pale green	Precipitate does not dissolve
Cu^{2+}	Pale blue ppt	Precipitate does not dissolve
Zn^{2+}	White ppt	Colourless solution

The equations for these reactions are similar; each of the transition metal ions should be written as the hexa-aqua ion, except for zinc which forms a tetra-aqua ion. In each case the precipitates formed are the simple hydroxide compounds.

For example:

and for zinc,

The reaction mechanism for this process is important and often examined. When aqueous transition metal ion react with hydroxide ions the reaction mechanism is **deprotonation**.

Notice how a H^{+} ion (a proton) is removed from the aqua ligand leaving a hydroxide ion. Note that this is **not** a ligand exchange.

As can be seen from the results, few transition metal ions react in excess sodium hydroxide.

Most metal hydroxides are basic, so the metal hydroxide precipitates formed in these reactions do not react in excess sodium hydroxide, itself a strong base.

However, some metal hydroxides (e.g. $\text{Cr}(\text{OH})_3$) are **amphoteric**, so will react with NaOH.

Practical 2 – Addition of ammonia solution

Dilute ammonia solution is added dropwise to aqueous transition metal ions. Initially a precipitate is looked for, then the ammonia solution is added to excess to find out if the precipitate will eventually re-dissolve.

Ion	Addition of NH_3 (aq)	Addition of excess NH_3 (aq)
Cr^{3+}	Green ppt	Precipitate does not dissolve
Mn^{2+}	Buff ppt, darkens in air	Precipitate does not dissolve
Fe^{2+}	Pale green ppt, browns on surface	Precipitate does not dissolve
Fe^{3+}	Red brown ppt	Precipitate does not dissolve
Co^{2+}	Blue ppt, turns brown in air	Precipitate does not dissolve
Ni^{2+}	Pale green	Blue solution
Cu^{2+}	Pale blue ppt	Deep blue solution
Zn^{2+}	White ppt	Colourless solution

On adding aqueous ammonia solution, it is hydroxide (OH^{-}) ions, which are again introduced and react with the transition metal ions.

The precipitates which forms are therefore the metal hydroxides again, just as when sodium hydroxide was the aqueous alkali added.

It is when the ammonia solution is added to excess that the reactions vary when comparing results to practical 1.

Ammonia is a **weak** base, too weak to react with the amphoteric metal hydroxides (e.g. $\text{Cr}(\text{OH})_3$).
