### Advances of Spectrometric Techniques in Food Analysis and Food Authentication Implemented with Chemometrics

Ioannis K. Karabagias, 2020-12-23 Given the continuous consumer demand for products of high quality and specific origin there is a great tendency toward the application of multiple instrumental techniques for the complete characterization of foodstuffs or related natural products Spectrometric techniques usually offer a full and rapid screenshot of a product's composition and properties by the determination of specific biomolecules such as sugars minerals polyphenols volatile compounds amino acids and organic acids The present Special Issue aimed firstly to enhance the advances of the application of spectrometric techniques such as gas chromatography coupled to mass spectrometry GC MS inductively coupled plasma optical emission spectrometry ICP OES isotope ratio mass spectrometry IRMS nuclear magnetic resonance NMR Raman spectroscopy or any other spectrometric technique in the analysis of foodstuffs such as meat milk cheese potatoes vegetables fruits fruit juices honey olive oil chocolate and other natural products An additional goal was to fill the gap between food composition food properties natural product properties and food natural product authenticity using supervised and non-supervised chemometrics

### **3D Printing of Pharmaceuticals and Drug Delivery Devices**

Dimitrios A. Lamprou, 2020-07-01 The 3D printing 3DP process was patented in 1986 however only in the last decade has it begun to be used for medical applications as well as in the fields of prosthetics bio fabrication and pharmaceutical printing 3DP or additive manufacturing AM is a family of technologies that implement layer by layer processes in order to fabricate physical models based on a computer aided design CAD model 3D printing permits the fabrication of high degrees of complexity with great reproducibility in a fast and cost effective fashion 3DP technology offers a new paradigm for the direct manufacture of individual dosage forms and has the potential to allow for variations in size and geometry as well as control dose and release behavior Furthermore the low cost and ease of use of 3DP systems means that the possibility of manufacturing medicines and medical devices at the point of dispensing or at the point of use could become a reality 3DP thus offers the perfect innovative manufacturing route to address the critical capability gap that hinders the widespread exploitation of personalized medicines for molecules that are currently not easy to deliver This Special Issue will address new developments in the area of 3D printing and bioprinting for drug delivery applications covering the recent advantages and future directions of additive manufacturing for pharmaceutical products

Cave, 2004 This work explores the way in which novel chemical criteria can be used to identify charred remains of grains of small grained grasses used as food by pre agrarian hunter gatherers in south western Asia but which have hitherto rarely been identified with any precision The grass family Gramineae or Poaceae is the most diverse abundant and widespread family of higher plants on the planet Grasses correspondingly have enormous ecological and economic importance worldwide Their importance is reflected in the prominent role of grain from wild grasses in hunter gatherer subsistence In order to reconstruct past subsistence practices and diet especially of arid zone hunter gatherers it is important to identify the remains of grasses recovered from archaeological sites However the recovered grass remains are most often charred therefore the interpretive potential can be realized only if these charred remains are accurately identified at the level of genus and in some cases species There are enormous problems in identifying charred remains particularly when relying totally on gross morphological criteria There is therefore a need for alternative criteria such as that utilized by chemical analytical techniques The core rationale in applying the different chemical techniques is the same throughout grains are taken from modern grasses of known identity and spanning a spectrum of taxa likely to include all the charred ancient specimens to be identified the unknowns These modern grains are then analysed to generate spectra Equivalent spectra from unknowns are then compared with those from the modern grains to effect an identification Standard practice has hitherto involved

comparing the two sets of spectra known and unknowns by visual inspection i.e. by eye. However, identifications based on such comparisons are inevitably to some degree untestable and unrepeatable and this represents a long-standing problem in chemistry generally. In the present project, the author has therefore explored the use of chemometrics i.e. the use of statistical systems to compare spectra in a manner that is rigorously testable and repeatable. This is an entirely new development and has never previously been applied in the analysis of archaeological data. **Commerce Business Daily**, 1999-05
