Cell Transport Study Guide

1. What does homeostasis mean? How do the cells maintain homeostasis?
Homeostasis means that the cell maintains a constant internal condition by responding to their internal and external environment.
Cells maintain homeostasis by controlling the movement of substances across their cell membrane.
2. What are the two kinds of transport that can happen in the cell?
The two types of transport that can happen in the cell are passive transport and active transport.
3. What is the difference between the two kinds of transport?
Passive transport does not require energy.
Active transport requires energy.
4. What does it mean if I say there is a concentration gradient?
There is a concentration gradient means that the concentration (amount) of a substance on one side is higher than the concentration on the other side.
5. What is the ultimate goal for each cell to reach? What does it mean when they reach this state?
The ultimate goal for a cell is reach EQUILIBRIUM.
When a cell reaches equilibrium it means that the concentration of a substance is equal on both sides of a membrane.
6. Which type of transport needs energy? Why do they need that energy (talk about the concentration gradient)?
Active transport needs energy.
They need the energy because the substance being transported goes against the concentration gradient.
7. Which type of transport does not need energy? Why don't they need that energy (talk about the concentration gradient)?
Passive transport does not need energy.
They do not need to use energy because the substance being transported goes in the same directions as the concentration gradient.
8. Are the molecules still moving when the cell reaches equilibrium?
Yes molecules are constantly moving.
9. What are the two types of passive transport the cell can go through?
Passive transport consists of diffusion and osmosis.

High-dimensional Nonlinear Diffusion Stochastic Processes Yevgeny Mamontov,Magnus Willander,2001-01-19 This book is the first one devoted to high dimensional or large scale diffusion stochastic processes DSPs with nonlinear coefficients These processes are closely associated with nonlinear Ito s stochastic ordinary differential equations ISODEs and with the space discretized versions of nonlinear Ito s stochastic partial integro differential equations The latter models include Ito s stochastic partial differential equations ISPDEs The book presents the new analytical treatment which can serve as the basis of a combined analytical numerical approach to greater computational efficiency in engineering problems A few examples discussed in the book include the high dimensional DSPs described with the ISODE systems for semiconductor circuits the nonrandom model for stochastic resonance and other noise induced phenomena in high dimensional DSPs the modification of the well known stochastic adaptive interpolation method by means of bases of function spaces ISPDEs as the tool to consistently model non Markov phenomena the ISPDE system for semiconductor devices the corresponding classification of charge transport in macroscale mesoscale and microscale semiconductor regions based on the wave diffusion equation the fully time domain nonlinear friction aware analytical model for the velocity covariance of particle of uniform fluid simple or dispersed the specific time domain analytics for the long non exponential tails of the velocity in case of the hard sphere fluid These examples demonstrate not only the capabilities of the developed techniques but also emphasize the usefulness of the complex system related approaches to solve some problems which have not been solved with the traditional statistical physics methods yet From this veiwpoint the book can be regarded as a kind of complement to such books as Introduction to the Physics of Complex Systems The Mesoscopic Approach to Fluctuations Nonlinearity and Self Organization by Serra Andretta Compiani and Zanarini Stochastic Dynamical Systems Concepts Numerical Methods Data Analysis and Statistical

Physics An Advanced Approach with Applications by Honerkamp which deal with physics of complex systems some of the corresponding analysis methods and an innovative stochastics based vision of theoretical physics To facilitate the reading by nonmathematicians the introductory chapter outlines the basic notions and results of theory of Markov and diffusion stochastic processes without involving the measure theoretical approach This presentation is based on probability densities commonly used in engineering and applied sciences

Live Imaging in Zebrafish Karuna Sampath,2010 The zebrafish embryo has now been well established as an organism of choice for the genetic and cell biological basis of vertebrate development Large scale forward genetic screens together with reverse genetic tools have resulted in a flood of new information on the regulation of vertebrate development Furthermore the unique transparency of the zebrafish embryo allows unprecedented access to cells and tissues and many important discoveries on gene function have already been made using live imaging techniques in this organism This book successfully brings together state of the art methodologies of live imaging such as the use of fluorescence correlation spectroscopy FCS that will be useful for investigators in the field of developmental biology to address their favorite problem using cell biological approaches in the zebrafish One of the key reasons that has made the zebrafish such a popular vertebrate model is its transparency and its potential for high resolution cell biology and imaging However there is no comprehensive and up to date guide to the new live imaging tools that can now be used in the zebrafish Furthermore there are many new microscopy methods that have been adapted for use in zebrafish and this book can be a good guide even for scientists already familiar with the imaging advantages of this model
