Instrument Engineers' Handbook, Volume Two Bela G. Liptak, 2018-10-08. The latest update to Bela Liptak's acclaimed bible of instrument engineering is now available. Retaining the format that made the previous editions bestsellers in their own right, the fourth edition of *Process Control and Optimization* continues the tradition of providing quick and easy access to highly practical information. The authors are practicing engineers, not theoretical people from academia, and their from the trenches advice has been repeatedly tested in real life applications. Expanded coverage includes descriptions of overseas manufacturer's products and concepts, model based optimization in control theory, new major inventions and innovations in control valves, and a full chapter devoted to safety. With more than 2000 graphs, figures, and tables, this all inclusive encyclopedic volume replaces an entire library with one authoritative reference. The fourth edition brings the content of the previous editions completely up to date, incorporates the developments of the last decade, and broadens the horizons of the work from an American to a global perspective. Bela G. Liptak speaks on Post Oil Energy Technology on the AT T Tech Channel.

Optimization of adaptive test design methods for the determination of steady-state data-driven models in terms of combustion engine calibration Sandmeier, Nino, 2022-12-01. This thesis deals with the development of a model based adaptive test design strategy with a focus on steady state combustion engine calibration. The first research topic investigates the question how to handle limits in the input domain during an adaptive test design procedure. The second area of scope aims at identifying the test design method providing the best model quality improvement in terms of overall model prediction error. To consider restricted areas in the input domain, a convex hull based solution involving a convex cone algorithm is developed, the outcome of which serves as a boundary model for a test point search. A solution is derived to enable the application of the boundary model to high dimensional problems without calculating the exact convex hull and cones. Furthermore, different data driven engine modeling methods are compared, resulting in the Gaussian process model as the most suitable one for a model based calibration. To determine an appropriate test design method for a Gaussian process model application, two new strategies are developed and compared to state of the art methods. A simulation based study shows the most benefit applying a modified mutual information test design followed by a newly developed relevance based test design with less computational effort. The boundary model and the relevance based test design are integrated into a multicriterial test design strategy that is tailored to match the requirements of combustion engine test bench measurements. A simulation based study with seven and nine input parameters and four outputs each offered an average model quality improvement of 36 % and an average measured input area volume increase of 65 % compared to a non adaptive space filling test design. The multicriterial test design was applied to a test bench measurement with seven inputs for verification.

Compared to a space filling test design measurement the improvement could be confirmed with an average model quality increase of 17 % over eight outputs and a 34 % larger measured input area Diese Arbeit befasst sich mit der Entwicklung einer modellbasierten adaptiven Versuchsplanungsstrategie f r die Anwendung in der Applikation des Station rverhaltens von Verbrennungsmotoren Der erste Forschungsteil untersucht wie sich Grenzen im Eingangsraum in die Versuchsplanung eines adaptiven Prozesses einbinden lassen Ein weiterer Fokus liegt auf der Identifikation einer modellbasierten Versuchsplanung die eine bestm gliche Verbesserung der globalen Modellqualit t hinsichtlich des Pr diktionsfehlers erm glicht Es wird ein Grenzraummodell auf Basis der konvexen H lle unter Zuhilfenahme eines Algorithmus zur Bestimmung eines konvexen Konus entwickelt das als Grundlage f r eine Versuchsplanung in beschr nkten Eingangsrumen verwendet wird Um die Anwendbarkeit bei hochdimensionalen Problemstellungen zu gew hrleisten wird ein Verfahren vorgestellt das eine Berechnung auch ohne die Bestimmung der exakten konvexen H lle und konvexen Konen erm glicht Des Weiteren werden verschiedene Methoden zur datengetriebenen Modellbildung des Verbrennungsmotors verglichen wobei das Gau Prozess Modell als die geeignetste Modellierungsmethode hervorgeht Um die bestm gliche Versuchsplanungsmethode bei der Anwendung des Gau Prozess Modells zu ermitteln werden zwei neue Strategien entwickelt und mit verf gbaren Methoden aus der Literatur verglichen Eine simulationsbasierte Studie zeigt dass eine angepasste Mutual Information Methode die besten Ergebnisse liefert Ein neu entwickeltes relevanzbasiertes Verfahren erreicht die zweitbesten Ergebnisse bietet aber einen geringeren Berechnungsaufwand als das Mutual Information Verfahren Das Grenzmodell und das relevanzbasierte Verfahren werden in einem multikriteriellen Versuchsplanungsverfahren zusammengef hrt das an die Anforderungen von Messungen an einem Verbrennungsmotorenpr fstand angepasst ist In einer simulationsbasierten Studie mit sieben bzw neun Eingangsparametern und jeweils vier Ausg ngen konnte eine durchschnittliche Modellqualit tsverbesserung von 36 % und eine mittlere Vergr erung des vermessenen Eingangsraumvolumens von 65 % im Vergleich zu einer nichtadaptiven raumf llenden Versuchsplanung gezeigt werden Das multikriterielle Versuchsplanungsverfahren wurde anhand von Pr fstandsmessungen mit sieben Eingangsparametern verifiziert Im Vergleich zu einer raumf llenden Versuchsplanung konnte eine mittlere Modellqualit tsverbesserung ber alle acht Ausg nge von 17 % und ein um 34 % vergr eretes vermessenenes Eingangsraumvolumen erreicht werden wodurch die Ergebnisse der Simulationen best tigt werden konnten **Analysis**
