Blackford, 2011-12-30 In the spring of 2007 National Geographic warned The oceans are in deep blue trouble From the northernmost reaches of the Greenland Sea to the swirl of the Antarctic Circle we are gutting our seas of fish There were legitimate grounds for concern After increasing more than fourfold between 1950 and 1994 the global wild fish catch reached a plateau and stagnated despite exponential growth in the fishing industry As numerous scientific reports showed many fish stocks around the world collapsed creating a genuine global overfishing crisis Making Seafood Sustainable analyzes the ramifications of overfishing for the United States by investigating how fishers seafood processors retailers government officials and others have worked together to respond to the crisis Historian Mansel G Blackford examines how these players took steps to make fishing in some American waters especially in Alaskan waters sustainable Critical to these efforts Blackford argues has been government and industry collaboration in formulating and enforcing regulations What can be learned from these successful experiences Are they applicable elsewhere What are the drawbacks Making Seafood Sustainable addresses these questions and suggests that sustainable seafood management can be made to work The economic and social costs incurred in achieving sustainable resource usage are significant but there are ways to mitigate them More broadly this study illustrates ways to manage commonly held natural resources around the world land water oil and so on in sustainable ways **GLOBEFISH**

The Big Book of Paleo Recipes Linda Larsen,2015-01-02 Contains material adapted and abridged from The everything weeknight paleo cookbook edited by Michelle Fagone copyright 2014 Title page verso Improving productivity and environmental performance of aquaculture Waite, R.,Beveridge, M.,Brummett, R.,Castine, S.,Chaiyawannakarn, N.,Kaushik, S.,Mungkung, R.,Nawapakpilai, S.,Phillips, M.,2014-09-01 Fish including finfish and shellfish are an important item in the human food basket contributing 17 percent of the global animal based protein supply in 2010 They are an

especially valuable food source in developing countries where more than 75 percent of the world's fish consumption occurs. In addition to protein, fish contain micronutrients and long-chain omega-3 fatty acids that are essential for maternal and child health but often deficient in the diets of the poor. However, the global supply of wild-caught fish has long peaked and is unlikely to rise again unless overexploited stocks are rehabilitated. As world fish consumption continues to grow, aquaculture fish farming has emerged to meet demand. Already, just under half of all fish that people consume come from aquaculture, which is one of the world's fastest growing animal food producing sectors. With the supply of wild-caught fish stagnant, any future increase in world fish consumption will need to be supplied by aquaculture. This working paper explores the potential role of aquaculture in meeting global fish demand in 2050, finding that aquaculture production will need to more than double by midcentury. The authors examine scenarios of aquaculture's growth and environmental impacts in 2050 and close with a series of recommendations for how to sustainably grow aquaculture production.
