Structural Seismic Design Optimization and Earthquake Engineering: Formulations and Applications Plevris, Vagelis, 2012-05-31 Throughout the past few years there has been extensive research done on structural design in terms of optimization methods or problem formulation But much of this attention has been on the linear elastic structural behavior under static loading condition Such a focus has left researchers scratching their heads as it has led to vulnerable structural configurations What researchers have left out of the equation is the element of seismic loading It is essential for researchers to take this into account in order to develop earthquake resistant real world structures Structural Seismic Design Optimization and Earthquake Engineering Formulations and Applications focuses on the research around earthquake engineering in particular the field of implementation of optimization algorithms in earthquake engineering problems Topics discussed within this book include but are not limited to simulation issues for the accurate prediction of the seismic response of structures design optimization procedures soft computing applications and other important advancements in seismic analysis and design where optimization algorithms can be implemented Readers will discover that this book provides relevant theoretical frameworks in order to enhance their learning on earthquake engineering as it deals with the latest research findings and their practical implementations as well as new formulations and solutions

Risk Management Series: Designing for Earthquakes - A Manual for Architects Federal Emergency Agency, U. S. Department Security, 2013-04-14 Earthquakes in the United States are regional in their occurrence and while California is famous for its earthquake other states such as Texas have much less concern for the threat of temblors However architectural practice is becoming increasingly national and global and the architect in Texas may find that the next project is in California Thus it has become necessary for the professional architect to have some knowledge of the earthquake problem and how design seeks to control it Designing for Earthquakes a Manual for Architects is intended to explain the principles of seismic design for those without a technical background in engineering and seismology The primary intended audience is that of architects and includes practicing architects architectural students and faculty in architectural schools who teach structures and seismic design For this reason the text and graphics are focused on those aspects of seismic design that are important for the architect to know

Because of its non technical approach this publication will also be useful to anyone who has an interest and concern for the seismic protection of buildings including facility managers building owners and tenants building committee participants emergency service personnel and building officials Engineers and engineering students will also gain from this discussion of seismic design from an architectural viewpoint The principles discussed are applicable to a wide range of building types both new and existing The focus is on buildings that are designed by a team that includes architects engineers and other consultants

Displacement-based Seismic Design of Structures M. J. N. Priestley, Gian Michele Calvi, Mervyn J. Kowalsky, 2007 Displacement Based Seismic Design of Structures is a book primarily directed towards practicing structural designers who are interested in applying performance based concepts to seismic design Since much of the material presented in the book has not been published elsewhere it will also be of considerable interest to researchers and to graduate and upper level undergraduate students of earthquake engineering who wish to develop a deeper understanding of how design can be used to control seismic response The design philosophy is based on determination of the optimum structural strength to achieve a given performance limit state related to a defined level of damage under a specified level of seismic intensity Emphasis is also placed on how this strength is distributed through the structure This takes two forms methods of structural analysis and

capacity design It is shown that equilibrium considerations frequently lead to a more advantageous distribution of strength than that resulting from stiffness considerations Capacity design considerations have been re examined and new and more realistic design approaches are presented to insure against undesirable modes of inelastic deformation The book considers a wide range of structural types including separate chapters on frame buildings wall buildings dual wall frame buildings masonry buildings timber structures bridges structures with isolation or added damping devices and wharves These are preceded by introductory chapters discussing conceptual problems with current force based design seismic input for displacement based design fundamentals of direct displacement based design and analytical tools appropriate for displacement based design The final two chapters adapt the principles of displacement based seismic design to assessment of existing structures and present the previously developed design information in the form of a draft building code The text is illustrated by copious worked design examples 39 in all and analysis aids are provided in the form of a CD containing three computer programs covering moment curvature analysis Cumbia linear element based inelastic time history analysis Ruaumoko and a general fibre element dynamic analysis program SeismoStruct The design procedure developed in this book is based on a secant stiffness rather than initial stiffness representation of structural response using a level of damping equivalent to the combined effects of elastic and hysteretic damping The approach has been fully verified by extensive inelastic time history analyses which are extensively reported in the text The design method is extremely simple to apply and very successful in providing dependable and predictable seismic response Authors Bios M J N Priestley Nigel Priestley is Professor Emeritus of the University of California San Diego and co Director of the Centre of Research and Graduate Studies in Earthquake Engineering and Engineering Seismology ROSE School Istituto Universitario di Studi Superiori IUSS Pavia Italy He has published more than 450 papers mainly on earthquake engineering and received numerous awards for his research He holds honorary doctorates from ETH Zurich and Cujo Argentina He is co author of two previous seismic design books Seismic Design of Concrete and Masonry Buildings and Seismic Design and Retrofit of Bridges that are considered standard texts on the subjects G M Calvi Michele Calvi is Professor of the University of Pavia and Director of the Centre of Research and Graduate Studies in Earthquake Engineering and Engineering Seismology ROSE School Istituto Universitario di Studi Superiori IUSS of Pavia He has published more than 200 papers and is co author of the book Seismic Design and Retrofit of Bridges that is considered a standard text on the subject has been involved in important construction projects worldwide such as the Rion Bridge in Greece and the upgrading of the Bolu Viaduct in Turkey and is coordinating several international research projects M J Kowalsky Mervyn Kowalsky is Associate Professor of Structural Engineering in the Department of Civil Construction and Environmental Engineering at North Carolina State University and a member of the faculty of the ROSE School His research which has largely focused on the seismic behaviour of structures has been supported by the National Science Foundation the North Carolina and Alaska Departments of Transportation and several

industrial organizations He is a registered Professional Engineer in North Carolina and an active member of several national and international committees on Performance Based Seismic Design
