

Changes in Temperature with Height

We define four layers of the atmosphere (the troposphere, stratosphere, mesosphere, and thermosphere) according to their average lapse rate—the rate at which temperature changes with height (Figure 1-2). Although the lapse rate at any given time or place will differ from this average, the figure provides a starting point for understanding the temperature profile of the atmosphere. The tropopause, stratopause, and mesopause mark the top (end) of each layer.

7. Ozone is a good absorber of ultraviolet radiation from the Sun. Its concentration is highest in the stratosphere. How does it influence the stratospheric lapse rate?

Temperature increases in this region due to absorption of ultraviolet ray.

Tropospheric Lapse Rate

Let us examine in more detail the environmental lapse rate in the troposphere—the layer in which most weather phenomena occur. When averaged over all seasons, air temperature is 15°C at Earth's surface and decreases by 6.5°C per kilometer in the lowest 11 kilometers (km). Consequently, this decrease is often referred to as the average lapse rate—the average for all locations and seasons. The resulting temperatures characterize the "standard atmosphere" shown in Table 1-2. Of course, the measured atmospheric lapse rate for a specific time and place will likely differ from the average.

8. Fill in the temperature values in Table 1-2 for the standard atmosphere from 2000 to 10,000 meters.
9. Table 1-2 also lists atmospheric temperatures measured at various heights above Key West, Florida, and Fairbanks, Alaska, on October 5, 2005, 12:00 Greenwich Mean Time (GMT). Plot the temperature values for these two stations and the standard atmosphere on the graph beneath the table.
