Sound Visualization and Manipulation Yang-Hann Kim, Jung-Woo Choi, 2013-08-30. Unique in addressing two different problems, sound visualization and manipulation in a unified way. Advances in signal processing technology are enabling ever more accurate visualization of existing sound fields and precisely defined sound field production. The idea of explaining both the problem of sound visualization and the problem of the manipulation of sound within one book supports this inter-related area of study. With rapid development of array technologies, it is possible to do much in terms of visualization and manipulation among other technologies involved with the spatial distribution of sound. This book aims to explore various basic functions for the visualization and manipulation and demonstrate to the reader how these properties determine the quality of visualization and manipulation. The first half of the book introduces some basic and general concepts and theories, and the second part of the book explains a number of techniques in sound visualization and manipulation. It offers a unified presentation to two very different topics: sound field visualization techniques based on microphone arrays and techniques for generation of controlled sound fields using loudspeaker arrays. The authors emphasize the similarities between these two physical problems and between the mathematical methods used for solving them. With extensive examples throughout the book, chapters include: Acoustic Wave Equation and its Basic Physical Measures, Acoustic Wave Equation and its Basic Physical Measures, Basic Theory of Sound Visualization, Acoustic Holography, Beamforming, Basic Theory of Sound Manipulation, Sound Focusing, and Sound Field Reproduction. The first book to combine both the visualization and manipulation of sound technologies in one comprehensive volume. Presents the basic concepts using simple one-dimensional cases and then extends the concept to three-dimensional cases, enabling easier understanding of the fundamental concepts through the use of minimum mathematics. Provides a solid understanding of associated physics as well as mathematical concepts for understanding the technologies addressing diffraction problems in an integrated format by using Kirchhoff-Helmholtz integral equation. Uses extensive examples demonstrating the benefits and drawbacks of various applications, including beamforming and acoustic holography. A valuable resource for postgraduate students, acoustic engineers, audio and noise control system developers.

Spatial Computing:

Issues In Vision, Multimedia And Visualization Technologies Horst Bunke,Lam Peng,Terry Michael Caelli,1997-08-27

This book is the result of a special workshop on Spatial Computing which brought together experts in computer vision visualization multimedia and geographic information systems to discuss common problems and applications The common theme of the workshop was the need to integrate human perception and domain knowledge with developing representations and solutions to problems which necessarily involve the interpretation of sensed data The overwhelming conclusion was that these different areas of spatial computing should be communicating more than is done at present and that such workshops and publications would help this process *Resources in Education* ,1994 GPU Solutions to Multi-scale Problems in

Vladimir Geroimenko,Chaomei Chen,2006-07-01 The Semantic Web is a vision that has sparked a wide ranging enthusiasm for a new generation of the Web The Semantic Web is happening The central idea of that vision is to make the Web more understandable to computer programs so that people can make more use of this gigantic asset The use of metadata data about data can clearly indicate the meaning of data on the Web so as to provide computers enough information to handle

such data On the future Web many additional layers will be required if we want computer programs to handle the semantics the meaning of data properly without human intervention Such layers should deal with the hierarchical relationships between meanings their similarities and differences logical rules for making new inferences from the existing data and metadata and so on Dozens of new technologies have emerged recently to implement these ideas XML eXtensible Markup Language forms the foundation of the future Web RDF Resource Description Framework OWL Web Ontology Language and many other technologies help to erect a multistory building of the Semantic Web layer by layer by adding new features and new types of metadata According to Tim Berners Lee the inventor of the current Web and the Semantic Web it may take up to ten years to complete the building The new Web will be much more complex than the current one and will contain enormous amounts of metadata as well as data
