

chamber of the carburetor which is supplied with fuel through the main jet (i. e. types 44 PHH and 40 P10). This application can also be found in the secondary barrel of compound downdraught carburetors (type 32 PAITA).

The fuel mixture is discharged through a connection between the emulsion tube well and the choke tube. This connection may be a simple tube (mixture discharge tube) or it may be a ring diffuser.

5. The Accelerator Pump

Generally accelerator pumps are needed for acceleration, and give the greatest advantage the longer the induction manifolds are, the greater the diameter of the induction manifold or respectively the choke tube in relation to the capacity of one cylinder.

Accelerator Pumps are generally mechanically operated (fig. 29). On older types of carburetor pneumatic pumps are also found (fig. 30). In the first case the pump is connected to the throttle spindle by a control rod; in the second case it is operated by depression.

When the throttle butterfly is opened the pump lever exerts pressure on the membrane. The pump pressure injects additional fuel into the mixing chamber through the pump jet and the injector tube.

Fig. 29 Mechanically operated accelerator pump

When the throttle butterfly is opened the depression drops and the then over-riding tension of the pump spring releases the pump membrane. Additional fuel is forced through the pump valve and the pump jet into the emulsion tube well.
