The Role Of Currency In Institutional Portfolios:

Role of Currency in Institutional Portfolios Momtchil Pojarliev, Richard M. Levich, 2014 **Some Like It Hedged**

Momtchil Pojarliev, 2018-11-07 Foreign currency exposure is a by product of international investing When obtaining global asset exposure investors also obtain the embedded foreign currency exposure Left unmanaged this currency exposure acts like a buy and hold currency strategy which receives little or no risk premium and adds unwanted volatility In **Some Like It Hedged** the author shows that the impact of foreign currency exposure on institutional portfolios depends significantly on the base currency of the investors and the specific composition of their portfolios In general investors whose base currency is negatively correlated with global equities as are the US dollar and the Japanese yen will reduce the volatility of their portfolios by fully hedging foreign currency exposure In contrast investors whose home currency is positively correlated with global equities as is the Canadian dollar will benefit from keeping some unhedged foreign currency exposure in particular exposure to the US dollar Finally investors with larger allocations to domestic assets will experience only small reductions in volatility from hedging Pojarliev discusses a variety of options to address foreign currency exposures Although there is no single best practice solution for addressing foreign currency exposures institutional investors have three main choices Do nothing i e maintain unhedged foreign currency exposure Doing nothing is always the easiest option but from a risk return perspective it could be the worst available choice Currency has no long term expected return because although it is a risk exposure it is not an economic asset Hence long term currency returns are expected to be zero Hedging should therefore have no long term impact on the return and only affect the volatility The volatility reduction from hedging can be redeployed more efficiently by increasing exposure to economic assets for which a risk premium exists Hedge passively i e maintain a constant hedge ratio In general hedging some of the foreign currency risk will decrease the volatility of the portfolio The relationship between a specific hedge ratio and the decrease in volatility depends on the particular portfolio and most importantly on the base currency of the investor Yet passive hedging creates its own problems including negative cash flow generation when foreign currencies are appreciating and detracting from returns because of hedging costs Passive hedging might also introduce a major market timing risk If the base currency weakens after a passive policy is implemented the investor will suffer substantial hedging losses when the forward currency hedging contracts settle Hedge actively i e vary the hedge ratio One way to address the market timing risk of implementing a passive hedging program is to actively time the hedging of the foreign currencies An active hedging program seeks to reduce the risk of the foreign currency exposure but varies the hedge ratios for the various currencies based on market views to avoid negative cash flow and to generate positive returns A successful active hedging program should both add to the return of the portfolio and lower the volatility and it should outperform both an unhedged and a passive hedging benchmark The best choice to address foreign currency exposure will differ from institution to institution but it boils down to two fundamental factors First the optimal solution

depends on the importance of risk versus return and the institution's tolerance for negative cash flow. Second, investors must decide whether they believe that currency managers are able to achieve a positive information ratio over the long run after fees and, importantly, whether they will be able to identify these currency managers. Any currency policy will depend on the details of the specific portfolio in particular on the base currency of the investor and the size of the foreign currency exposure.

International Capital Flows Martin Feldstein, 2007-12-01 Recent changes in technology along with the opening up of many regions previously closed to investment have led to explosive growth in the international movement of capital Flows from foreign direct investment and debt and equity financing can bring countries substantial gains by augmenting local savings and by improving technology and incentives Investing companies acquire market access lower cost inputs and opportunities for profitable introductions of production methods in the countries where they invest But as was underscored recently by the economic and financial crises in several Asian countries capital flows can also bring risks Although there is no simple explanation of the currency crisis in Asia it is clear that fixed exchange rates and chronic deficits increased the likelihood of a breakdown Similarly during the

1970s the United States and other industrial countries loaned OPEC surpluses to borrowers in Latin America But when the U S Federal Reserve raised interest rates to control soaring inflation the result was a widespread debt moratorium in Latin America as many countries throughout the region struggled to pay the high interest on their foreign loans International Capital Flows contains recent work by eminent scholars and practitioners on the experience of capital flows to Latin America Asia and eastern Europe These papers discuss the role of banks equity markets and foreign direct investment in international capital flows and the risks that investors and others face with these transactions By focusing on capital flows productivity and determinants and the policy issues they raise this collection is a valuable resource for economists policymakers and financial market participants Foreign Currency Bank Funding and Global Factors Signe Krogstrup,Cédric Tille,2018-05-09 The literature on the drivers of capital flows stresses the prominent role of global financial factors Recent empirical work however highlights how this role varies across countries and time and this heterogeneity is not well understood We revisit this question by focusing on financial intermediaries funding flows in different currencies A concise portfolio model shows that the sign and magnitude of the response of foreign currency funding flows to global risk factors depend on the financial intermediary s pre existing currency exposure An analysis of a rich dataset of European banks aggregate balance sheets lends support to the model predictions especially in countries outside the euro area
