ABSTRACT

Three groups of novice pilots received training to fly aerobatic maneuvers in a light aircraft. Trainees in the control group received in-flight instruction and were given the usual briefings before each flight. Trainees in the two experimental groups received extra training: each in-flight lesson was preceded by PC-based simulated flight. A total of 2053 maneuvers were analyzed on the basis of both flight-data recordings and instructor ratings. We hypothesized that complex manual flying skills, learned on the ground, transfer to the aircraft. The results provide no objective support for this hypothesis. There were no significant differences in flying skills between the three groups as measured by the flight-data recordings. However, both experimental (PC-) groups managed to fly significantly more maneuvers in the same amount of flight time in the aircraft. Differences between flight-data recordings and instructor ratings are analyzed in detail. In the discussion, we compare the findings with published transfer-experiments with PC-based simulation.

1.0 INTRODUCTION

1.1 Low-Fidelity Training In Flight Instruction

Traditionally, the design of flight simulators for pilot training has been based on the assumption that the more a simulator behaves, responds, feels and looks like a real aircraft, the better will be the training. This is what we call the 'high-fidelity view of flight simulation'. However, this view has changed somewhat over the last few decades. Positive transfer to the actual in-flight environment has been demonstrated with low-fidelity PC-based simulation training in a number of experimental transfer studies ([1], [2], [3], [4], [5], [6], [7], [8], [9], [10]) that focus on the initial stage of flight training. All these studies demonstrated positive transfer for standard flying tasks, such as basic instrument tasks, visual landings, visual turns, etc. in the initial stage of flight training.

1.2 Moving Away From Fidelity

Intentional deviations from fidelity may even contribute positively to transfer, as was demonstrated by [8]. This evidence is supported by other transfer experiments that fall outside the PC-based category. An example is transfer to landing skills under crosswind conditions, which was higher after training without crosswind than after training with crosswind [11]. A number of experiments with 'augmenting' visual objects (such as

Aviation Psychology and Human Factors Monica Martinussen, David R. Hunter, 2017-07-12 This book covers the application of psychological principles and techniques to situations and problems of aviation. It offers an overview of the role psychology plays in aviation system design, selection and training of pilots, characteristics of pilots, safety and passenger behavior. It covers concepts of psychological research and data analysis and shows how these tools are used in the development of new psychological knowledge. The new edition offers material on physiological effects on pilot performance, a new chapter on aviation physiology, more material on fatigue, safety culture, mental health and safety, as well as practical examples and exercises after each chapter.

Learning, Training, and Development in Organizations Steve W.J. Kozlowski, Eduardo Salas, 2009-08-06 This scholarly book in SIOP's Organizational Frontier series looks at research on enhancing knowledge acquisition and its application in organizations. It concentrates on training design and delivery given the changing nature of work and organizations. Now that work is increasingly complex, there is greater emphasis on expertise and cognitive skills. Advances in technology such as computer simulations and web-based training are necessitating a more active role for the learner in the training process. In the broad context of the organization systems, this book promotes learning and development as a continuous lifelong endeavor.

Development of Professional Expertise K. Anders Ericsson, 2009-06-22 Professionals such as medical doctors, aeroplane pilots, lawyers and technical specialists find that some of their peers have reached high levels of achievement that are difficult to measure objectively. In order to understand to what extent it is possible to learn from these expert performers for the purpose of helping others improve their performance, we first need to reproduce and measure this performance. This book is designed to provide the first comprehensive overview of research on the acquisition and training of professional performance as measured by objective methods rather than by subjective ratings by supervisors. In this collection of articles, the world's foremost experts discuss methods for assessing the experts' knowledge and review our knowledge on how we can measure professional performance and design training environments that permit beginning and experienced professionals to develop and maintain their high levels of performance using examples from a wide range of professional domains.

Learning by Playing Fran Blumberg, 2014 There is a growing recognition in the learning sciences that video games can no longer be seen as impediments to education but rather they can be developed to enhance learning In *Learning By Playing* a diverse group of contributors provide perspectives on the most current thinking concerning the ramifications of leisure video game play for academic classroom learning *Vision and Displays for Military and Security Applications* Keith K. Niall, 2010-03-10 Realistic and immersive simulations of land sea and sky are requisite to the military use of visual simulation for mission planning Until recently the simulation of natural environments has been limited first of all by the pixel resolution of visual displays Visual simulation of those natural environments has also been limited by the scarcity of detailed and accurate physical descriptions of them Our aim has been to change all that To this end many of us have labored in adjacent fields of psychology engineering human factors and computer science Our efforts in these areas were occasioned by a single question how distantly can fast jet pilots discern the aspect angle of an opposing aircraft in visual simulation This question needs some elaboration it concerns fast jets because those simulations involve the representation of high speeds over wide swaths of landscape It concerns pilots since they begin their careers with above average acuity of vision as a population And it concerns aspect angle which is as much as to say that the three dimensional orientation of an opposing aircraft relative to one's own as revealed by motion and solid form is *vi* Preface The single question is by no means simple It demands a criterion for eye limiting resolution in simulation That notion is a central one to our study though much abused in general discussion The question at hand as it was posed in the 1990s has been accompanied by others *Human factors of cockpit automation* Earl L.
