## **Punchline Algebra A:**

*Punchline Algebra* Steve Marcy, Janis Marcy, 2006      **Conics** Keith Kendig, 2020-07-29 This book engages the reader in a journey of discovery through a spirited discussion among three characters philosopher teacher and student Throughout the book philosopher pursues his dream of a unified theory of conics where exceptions are banished With a helpful teacher and example hungry student the trio soon finds that conics reveal much of their beauty when viewed over the complex numbers It is profusely illustrated with pictures worked out examples and a CD containing 36 applets Conics is written in an easy conversational style and many historical tidbits and other points of interest are scattered throughout the text Many students can self study the book without outside help This book is ideal for anyone having a little exposure to linear algebra and complex numbers      *Abstract Algebra* Joseph H. Silverman, 2022-03-07 This abstract algebra textbook takes an integrated approach that highlights the similarities of fundamental algebraic structures among a number of topics The book begins by introducing groups rings vector spaces and fields emphasizing examples definitions homomorphisms and proofs The goal is to explain how all of the constructions fit into an axiomatic framework and to emphasize the importance of studying those maps that preserve the underlying algebraic structure This fast paced introduction is followed by chapters in which each of the four main topics is revisited and deeper results are proven The second half of the book contains material of a more advanced nature It includes a thorough development of Galois theory a chapter on modules and short surveys of additional algebraic topics designed to whet the reader's appetite for further study This book is intended for a first introduction to abstract algebra and requires only a course in linear algebra as a prerequisite The more advanced material could be used in an introductory graduate level course      Excursions in Number Theory, Algebra, and Analysis Kenneth Ireland, Al Cuoco, 2023-03-27 This textbook originates from a course taught by the late Ken Ireland in 1972 Designed to explore the theoretical underpinnings of undergraduate mathematics the course focused on interrelationships and hands on experience Readers of this textbook will be taken on a modern rendering of Ireland's path of discovery consisting of excursions into number theory algebra and analysis Replete with surprising connections deep insights and brilliantly curated invitations to try problems at just the right moment this journey weaves a rich body of knowledge that is ideal for those going on to study or teach mathematics A pool of 200 Dialing In problems opens the book providing fuel for active enquiry throughout a course The following chapters develop theory to illuminate the observations and roadblocks encountered in the problems situating them in the broader mathematical landscape Topics cover polygons and modular arithmetic the fundamental theorems of arithmetic and algebra irrational algebraic and transcendental numbers and Fourier series and Gauss sums A lively accompaniment of examples exercises historical anecdotes and asides adds motivation and context to the theory Return trips to the Dialing In problems are encouraged offering opportunities to put theory into practice and make lasting connections along the way Excursions in Number Theory Algebra and Analysis invites readers on a journey as important as the

destination Suitable for a senior capstone professional development for practicing teachers or independent reading this textbook offers insights and skills valuable to math majors and high school teachers alike A background in real analysis and abstract algebra is assumed though the most important prerequisite is a willingness to put pen to paper and do some mathematics

**More Concise Algebraic Topology** J. P. May, K. Ponto, 2012-02 With firm foundations dating only from the 1950s algebraic topology is a relatively young area of mathematics There are very few textbooks that treat fundamental topics beyond a first course and many topics now essential to the field are not treated in any textbook J Peter May's A Concise Course in Algebraic Topology addresses the standard first course material such as fundamental groups covering spaces the basics of homotopy theory and homology and cohomology In this sequel May and his coauthor Kathleen Ponto cover topics that are essential for algebraic topologists and others interested in algebraic topology but that are not treated in standard texts They focus on the localization and completion of topological spaces model categories and Hopf algebras The first half of the book sets out the basic theory of localization and completion of nilpotent spaces using the most elementary treatment the authors know of It makes no use of simplicial techniques or model categories and it provides full details of other necessary preliminaries With these topics as motivation most of the second half of the book sets out the theory of model categories which is the central organizing framework for homotopical algebra in general Examples from topology and homological algebra are treated in parallel A short last part develops the basic theory of bialgebras and Hopf algebras

Rosenberg, 2013-03-09 This book is based on lectures delivered at Harvard in the Spring of 1991 and at the University of Utah during the academic year 1992-93 Formally the book assumes only general algebraic knowledge rings modules groups Lie algebras functors etc It is helpful however to know some basics of algebraic geometry and representation theory Each chapter begins with its own introduction and most sections even have a short overview The purpose of what follows is to explain the spirit of the book and how different parts are linked together without entering into details The point of departure is the notion of the left spectrum of an associative ring and the first natural steps of general theory of noncommutative affine quasi affine and projective schemes This material is presented in Chapter I Further developments originated from the requirements of several important examples I tried to understand to begin with the first Weyl algebra and the quantum plane The book reflects these developments as I worked

them out in real life and in my lectures In Chapter 11 we study the left spectrum and irreducible representations of a whole lot of rings which are of interest for modern mathematical physics The classes of rings we consider include as special cases quantum plane algebra of  $q$  differential operators quantum Heisenberg and Weyl algebras quantum enveloping algebra of the Lie algebra  $sl(2)$  coordinate algebra of the quantum group  $SL(2)$  the twisted  $SL(2)$  of Woronowicz so called Drinfeld algebra and many others
