ABOUT THE COVER. This image illustrates the trajectory of a moving point whose space coordinates satisfy (as functions of time) the

linear system of differential equations that is discussed on page 551, and which originated in studies of oscillations in chemical reactions. In its motion along its trajectory the point may appear to spiral repeatedly around a set — the so-called *Kuiper band* — that somewhat resembles a (twisted) Möbius strip in space. To portray the progress of the moving point, we can regard its trajectory as a necklace string on which beads are placed to mark its successive positions at fixed increments of time (as the point is moving faster where the spacing between beads is greater). In order to aid the eye in following the moving point's progress, the color of the beads changes continuously with the passage of time and motion along the trajectory. As the point travels around and around the band, it may be observed to drift radially back and forth across the band in an apparently unpredictable fashion. Two points that start from nearby initial positions may loop around and around the band somewhat in synchrony, while moving radially in quite different ways, so that their trajectories diverge appreciably with the passage of time. This illustrates the phenomenon of *chaos*, in which tiny differences in initial conditions can result in great differences in the resulting situations some time later. Further discussion of chaos associated with differential equations can be found in Section 7.6. Throughout this textbook computer-generated graphics are used to portray numerical and symbolic solutions of differential equations vividly and to provide additional insight.

Introductory Differential Equations Martha L. Abell,James P. Braselton,2009-09-09

This text is for courses that are typically called Introductory Differential Equations Introductory Partial Differential Equations Applied Mathematics Fourier Series and Boundary Value Problems The text is appropriate for two semester courses the first typically emphasizes ordinary differential equations and their applications while the second emphasizes special techniques like Laplace transforms and partial differential equations The text follows a traditional curriculum and takes the traditional rather than dynamical systems approach Introductory Differential Equations is a text that follows a traditional approach and is appropriate for a first course in ordinary differential equations including Laplace

transforms and a second course in Fourier series and boundary value problems Note that some schools might prefer to move the Laplace transform material to the second course which is why we have placed the chapter on Laplace transforms in its location in the text Ancillaries like Differential Equations with Mathematica and or Differential Equations with Maple would be recommended and or required ancillaries depending on the school course or instructor Technology Icons These icons highlight text that is intended to alert students that technology may be used intelligently to solve a problem encouraging logical thinking and application Think About It Icons and Examples Examples that end in a question encourage students to think critically about what to do next whether it is to use technology or focus on a graph to determine an outcome Differential Equations at Work These are projects requiring students to think critically by having students answer questions based on different conditions thus engaging students Solutions to Selected Exercises, Elementary Differential Equations, Sixth Edition Earl David Rainville, Phillip Edward Bedient, 1981 *An Introduction to Ordinary Differential Equations* James C.
