Zimmerer,2006-09-15

Examining the geographical dimensions of environmental management and conservation activities implemented on landscapes worldwide *Globalization and New Geographies of Conservation* creates a new framework and collects original case studies to explore recent developments in the interaction of humans and their environment *Globalization and New Geographies of Conservation* makes four important arguments about the recent coupling of conservation and globalization that is reshaping the place of nature in human environmental change First it has led to an unprecedented number of spatial arrangements whose environmental management goals and prescribed activities vary along a spectrum from strict biodiversity protection to sustainable utilization involving agriculture food production and extractive activities Conservation and globalization are also leading by necessity to new scales of management in these activities that rely on environmental science thus shifting the spatial patterning of humans and the environment This interaction results as well in the unprecedented importance of boundaries and borders transnational border issues pose both opportunities and threats to global conservation proposed by organizations and institutions that are themselves international Lastly *Globalization and New Geographies of Conservation* argues that the local level has been integral to globalization while the regional level is often eclipsed at the peril of the successful implementation of conservation and management programs Bridging the gap between geography and life science *Globalization and New Geographies of Conservation* will appeal to a broad range of students of the environment conservation planning biodiversity management and development and globalization studies

### **Non-Destructive Techniques for the Evaluation of Structures and Infrastructure**

Belén Riveiro, Mercedes Solla, 2016-04-04 This book provides an overview and up to date synthesis of the most commonly used non destructive technologies for the reverse engineering of built infrastructure facilities These technologies tackle both the geometric and radiometric characterization of built structures and thus validated technologies such as laser scanning photogrammetry and *Groundwater Development and Management* Pradip K. Sikdar, 2018-07-27 This book deals with the challenges for efficient groundwater management with a focus on South Asia and India providing a balanced presentation of theory and field practice using a multidisciplinary approach Groundwater of South Asia is increasingly confronted with overuse and deteriorating quality and therefore requires urgent attention Management of the

stressed groundwater systems is an extremely complex proposition because of the intricate hydrogeological set up of the region. Strategies for sustainable management must involve a combination of supply side and demand side measures depending on the regional setting and socio economic situations. As a consequence the challenges of efficient groundwater management require not only a clear understanding of the aquifer configuration but also demand for the development of a comprehensive database of the groundwater occurrences and flow systems in each hydrogeological setting. In addition drilling and well construction methods that are appropriate to different hydrogeological formations need to be implemented as well as real time monitoring of the status of the groundwater use. Also corrective measures for groundwater that is threatened with depletion and quality deterioration need to be installed. Finally the legal framework of groundwater needs to be rearticulated according to the common property aspect of groundwater. These challenges should revolve around effective groundwater governance by creating an atmosphere to support and empower community based systems of decision making and revisit the existing legal framework and groundwater management institutions by fostering community initiatives. This book is relevant for academics, professionals, administrators, policy makers and economists concerned with various aspects of groundwater science and management.

**Remote Sensing Digital Image Analysis** John A. Richards, 2012-09-13. Remote Sensing Digital Image Analysis provides the non specialist with an introduction to quantitative evaluation of satellite and aircraft derived remotely retrieved data. Since the first edition of the book there have been significant developments in the algorithms used for the processing and analysis of remote sensing imagery nevertheless many of the fundamentals have substantially remained the same. This new edition presents material that has retained value since those early days along with new techniques that can be incorporated into an operational framework for the analysis of remote sensing data. The book is designed as a teaching text for the senior undergraduate and postgraduate student and as a fundamental treatment for those engaged in research using digital image processing in remote sensing. The presentation level is for the mathematical non specialist. Since the very great number of operational users of remote sensing come from the earth sciences communities the text is pitched at a level commensurate with their background. Each chapter covers the pros and cons of digital remotely sensed data without detailed mathematical treatment of computer based algorithms but in a manner conducive to an understanding of their capabilities and limitations. Problems conclude each chapter.

Mathematical Morphology Laurent Najman, Hugues Talbot, 2013-01-24. Mathematical Morphology allows for the analysis and processing of geometrical structures using techniques based on the fields of set theory, lattice theory, topology and random functions. It is the basis of morphological image processing and finds applications in fields including digital image processing, DSP as well as areas for graphs, surface meshes, solids and other spatial structures. This book presents an up to date treatment of mathematical morphology based on the three pillars that made it an important field of theoretical work and practical application: a solid theoretical foundation, a large body of applications and an efficient implementation. The book is divided into five parts and

includes 20 chapters The five parts are structured as follows Part I sets out the fundamental aspects of the discipline starting with a general introduction followed by two more theory focused chapters one addressing its mathematical structure and including an updated formalism which is the result of several decades of work Part II extends this formalism to some non deterministic aspects of the theory in particular detailing links with other disciplines such as stereology geostatistics and fuzzy logic Part III addresses the theory of morphological filtering and segmentation featuring modern connected approaches from both theoretical and practical aspects Part IV features practical aspects of mathematical morphology in particular how to deal with color and multivariate data links to discrete geometry and topology and some algorithmic aspects without which applications would be impossible Part V showcases all the previously noted fields of work through a sample of interesting representative and varied applications
