Robert D. Latzman, Christopher J. Patrick, 2025-03-21. This is the first book of its kind to bring together a diverse set of human and nonhuman animal researchers to explore neurobehavioral trait dimensions with optimal relevance to mental illness: threat sensitivity, reward sensitivity, inhibitory control, affiliative capacity, and schizotypy. The volume presents foundational material, methodological considerations, and the integration of animal and human studies, providing a careful investigation of neurobehavioral trait dimensions. A special feature is the inclusion of paired chapters contrasting animal and human studies that demonstrate the state of the field. It also discusses the most promising neurobehavioral trait dimensions for understanding the processes associated with human mental illness. This integrated perspective fosters a deeper understanding of how individual differences in neurobiology contribute to the diversity of human behavior and the complex nature of mental health disorders. Taken together, insights into neurobehavioral traits promise to catalyze new research directions, inform policy decisions, and ultimately improve outcomes for individuals grappling with mental illness.

Etiopathogenic Theories and Models in Depression Juan Pablo Jiménez, Alberto Botto, Peter Fonagy, 2022-02-03. This book reviews the different theories and models that seek to explain the causes of depression from different perspectives, from the molecular to the socio-cultural level. Depression is a complex psychopathological construct of high phenotypic heterogeneity which must be understood as a phenomenon in which different explanatory levels interact with each other. However, very little is known about this interaction. The aim of this book is to provide clinical psychologists and psychiatrists a better knowledge of the interaction of different etiopathogenic levels in order to help these professionals make better therapeutic decisions when treating depressed patients. Chapters in this volume review etiopathogenic theories and models of depression developed by different disciplines and fields of research such as clinical psychology, psychiatry, genetics, neurobiology, psychophysiology, psychoneuroendocrinology, and psychosocial studies, and examine certain conditions where the integrated consideration of different explanatory levels illuminates how depression originates and is maintained. In each

chapter authors critically review the state of the art in their field of expertise and explain the weak points of their own theories and their possible openness or connection to alternative theories or models Etiopathogenic Theories and Models in Depression will be a valuable resource for clinical psychologists psychiatrists and other health professionals working with depressed patients as well as to researchers investigating how depression originates and is maintained presenting an integrated perspective of high translational value for clinical practice *Charney and Nestler's Neurobiology of Mental Illness* Dennis Charney, Eric Nestler, Joseph D. Buxbaum, Elisabeth B. Binder, Joshua A. Gordon, Marina R. Picciotto, 2025-01-03

The genetic investigation into mental illnesses has progressed rapidly since the mapping of the human genome Driven by advances in genomic profiling technology massive genomic datasets are powering the discovery of genetic variation associated to complex traits including mental illness From severe neurodevelopmental disorders to schizophrenia and depression genetic variation plays some role in risk Critically most mental illnesses are complex multifactorial and the consequence of a combination of genetic and environmental influences This chapter will introduce the genome its variation and the methods used to identify what variants and genes matter for mental illnesses **The development of deep brain stimulation for neurological and psychiatric disorders: clinical, societal and ethical issues** Thomas E.
