

CHAPTER 8

Cellular respiration: involves the oxidation of organic molecules (usually carbohydrates and lipids) to produce energy (ATP) and release carbon dioxide and water.

ATP: Adenosine Triphosphate (ATP) is the primary energy currency of the cell. It is a nucleotide derivative composed of adenine, ribose, and a triphosphate group. The energy is stored in the high-energy phosphate bonds between the phosphate groups.

Energy yield: The oxidation of glucose yields approximately 36-38 ATP molecules per molecule of glucose. The energy is derived from the high-energy electrons carried by NADH and FADH₂, which are used to drive the electron transport chain.

Metabolic pathways: Cellular respiration involves several interconnected metabolic pathways, including glycolysis, the citric acid cycle, and the electron transport chain. These pathways are regulated by various enzymes and cofactors.

ATP synthase: This enzyme is responsible for the synthesis of ATP from ADP and inorganic phosphate (Pi) using the energy from the electron transport chain.

CHAPTER 9

Photosynthesis: the process by which plants and other organisms convert light energy into chemical energy (glucose) using carbon dioxide and water.

Light energy: is absorbed by chlorophyll and other pigments in the thylakoid membranes, which then transfer the energy to the reaction centers.

Water: is split into oxygen and protons (H⁺) during the light-dependent reactions.

Glucose: is the primary product of photosynthesis, which is used by the plant for energy and growth. It is also a source of carbon for other organisms.
