

1. What type of operon is illustrated in Model 1?

- Inducible operon

2. Consider the operon in Model 1. Other than the gene that regulates the operon, how many genes are contained within the operon?

- 3

3. In Model 1, where on the DNA strand does RNA polymerase bind to start transcription, the promoter, the operator or the terminator?

- binds to promoter

4. Which direction is the RNA polymerase moving in Model 1?

3' → 5'

5. In which diagram of Model 1 is transcription and translation occurring successfully, diagram A or diagram B? Justify your answer with evidence from Model 1.

Diagram B

Gene → protein

6. Consider the nonscience meaning of the following terms. Match the purpose with each of these sections in the operon in terms of gene transcription.

Promoter

Operator

Terminator

Spot where transcription ends

Spot where transcription begins

On/Off switch

7. Refer to diagram A in Model 1.

a. What protein does the regulatory gene in Model 1 produce?

- A repressor protein

b. To what section of the operon does this protein bind?

- binds to the operator site

c. Propose an explanation for why transcription is not occurring in diagram A.

- The repressor protein blocks RNA polymerase
so transcription of the genes cannot occur

Peters, 2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates Regulation of Gene Expression Molecular Mechanisms is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell **Control of Gene Expression**, 1974 *Regulation of gene expression* U Satyanarayana, 2014-11-07

Regulation of gene expression Regulation of gene expression **Translational Regulation of Gene Expression** J. Ilan, 2013-11-11 **Post-transcriptional Control of Gene Expression** Celine Sin, 2016 Gene expression describes the process of making functional gene products e g proteins or special RNAs from instructions encoded in the genetic information e g DNA This process is heavily regulated allowing cells to produce the appropriate gene products necessary for cell survival adapting production as necessary for different cell environments Gene expression is subject to regulation at several levels including transcription mRNA degradation translation and protein degradation When intact this system

maintains cell homeostasis keeping the cell alive and adaptable to different environments. Malfunction in the system can result in disease states and cell death. In this dissertation we explore several aspects of gene expression control by analyzing data from biological experiments. Most of the work following uses a common mathematical model framework based on Markov chain models to test hypotheses, predict system dynamics or elucidate network topology. Our work lies in the intersection between mathematics and biology.

Goldberger, 1979 *Translational Control of Gene Expression in Response to DNA-damaging Agents* Lucy A. Young, 2011

In response to DNA damage, cells initiate a complex DNA damage response, DDR, that includes mechanisms of DNA repair, cell cycle arrest or, in the cases of irreparable damage, apoptosis. Although regulation of the DDR has been extensively studied at the level of post-translational modifications and transcription, less is known about the role played by translational regulation. The data presented in this study describes the translational response and genome-wide translational profiles of human cells exposed to the DNA-damaging agents ethyl methanesulphonate (EMS) and ionising radiation (IR). Exposure of HeLa cells to EMS caused a 60% decrease in global protein synthesis mediated by phosphorylation of the α subunit of eukaryotic initiation factor 2 (eIF2), whereas IR modulated global protein synthesis through changes in 4E-BP phosphorylation. Polysome profiling by cDNA microarray was used to identify, on a genome-wide scale, the differential translation of mRNAs following exposure to EMS or IR. Functional analysis of the data revealed translational regulation of distinct subsets of genes that, in the most part, were unique to EMS or IR exposure. An enrichment of genes involved in the ER stress response was identified following exposure to EMS, whereas genes involved in the mitochondrial oxidative phosphorylation pathway and ubiquitin-proteasome pathway were identified following exposure to IR. These data suggest that translation of distinct subsets of mRNAs may be necessary to initiate appropriate stress responses following exposure to different types of DNA-damaging agents and, in agreement with previous studies, Powley et al. (2009) implicates translational control as an important mechanism of the DDR.
